Not in the least. Repeat after me: Equipment for a number of frequencies require type acceptance. Amateur equipment does not require type acceptance. A type accepted unit modified to operate wholly within Amateur frequencies is no longer type accepted but is perfectly legal in the ham bands. Part 95 simply does not apply.

A CB radio, or old 2MHz Marine radio, or Motorola VHF/UHF rig was at one time type-accepted for its intended use; it is not a shrine. It is perfectly legal for anyone to modify it out of both type-acceptance and the need for type acceptance.

thanks guys...

I picked up a cheap mobile unit and a lil' will tonight... just to get me started... if I enjoy it I am going to get a bigger radio in the months to come as well as upgrading to the will 1000 :)

again.. thanks for everyone's input..

No offense, but it seems rather ridiculous and stupid to have a tripod account and use it strictly as a referrer to your actual website which resides on GeoCities... If that is all you wanted to do with it, you could achieve the same thing (and have an even shorter URL to boot,) by using a site specifically designed for such a thing....

www.v3.com comes to mind... Give it a look....

This is true so long as the intended operation is on the CB band. However once its modified by a Ham, and used ONLY on the Ham bands, then Part 97 rules apply, not Part 95. Part 97 rules allow any Ham to build, or modify, any radio equipment they own, again as long as it is restricted to operation on the Ham bands. It's all pretty clearly spelled out. Just go to the ARRL web site and look up the Part 97 rules, and read them.

Look Andy, it appears that you are a shack on a belt kind of Technician, unaware of the rules, and unwilling to learn. A ham can own a transmitter capable of transmitting on any frequency in the spectrum. This is not to say that he can use it out of band. My rig will key at 1.701010 MHz. Since I am out of band I would at most put 5 watts into a dummie load to test it. This is legal to own. It is illegal to transmit out of band. I don't do that. I do us it with dummie loads to calibrate frequency counters. As long as nothing goes out, it is legal. Why are you arguing about this on the CB newsgripe?

I live in a land of sand, where 18 foot above sea level is referred to as a "Mt." Don't believe me? Grab an Atlas and check out Mt. Dora in the 'pile. Nightime conditions around the flatlands here with no skip rolling, we can do almost state wide in the wee hours WITH THE RIGHT CONDITIONS. Normally, we can get anywhere from about 25 miles on up when it's quiet in the wee hours. When the noise level is up during the day and skip is hammering, we get about 3 to 5 miles local (If we're lucky) with a barefoot rig, but can talk across country.

Yeah, I cheat. I usually use 444.850 on the WB2KAO repeater. Sometimes .750 the Kodak repeater - or .825 the Xerox repeater. No problem talking a LOT of miles then. My former neighbor listens in on the .750 repeater with a handheld scanner and a metal coat hanger for an antenna - and she lives in Wellsville, NY - over 103 miles by car (probably 80 as the crow flies).

Have a gooder!
Jim

My father was using the Sears til the day he passed away (Jan 91) along with a Thunderbolt 101 Linear. I've also got a Afterburner Model 403 and a HB-125 Penetrater, both of which I believe are operational but not sure.

If anyone is interested, please reply. I have photos of the Roadtalker and Thunderbolt and am waiting on photos for the other two. Make me an offer.

>We all agree you cannot modify a CB for CB Use, But you certainly can
>modify a CB if you are a Ham

No you can't. The FCC Rules, Part 95, Subsection D are very explicit. CB's may not be modified. Period. It doesn't say that CB's may not be modified unless you are a ham. It only says that a CB may not be modified.

But according to Part 95, a CB radio may not be modified. Period. End of discussion. It doesn't go into anything after that. There are no exceptions. As a matter of fact, it goes on to say that if a CB is modified it may no longer be operated.. it doesn't say "it may not longer be operated in CB", it says that it may no longer be operated.

Still wrong. FCC rules, Part 95, Subsection D specifically says that a CB may not be modified. So "once it's modified by a Ham", it's illegal. Throw it in the scrap heap.

I don't stay on VHF and talking to YOU guys is like talking to a brick wall.
The FCC rules are plain and simple. There is no room for interpretation. I
realize there's a group of hams on here seeking to justify their using illegal
radios and they don't want to accept what the law says. It's plain and simple.
According to the FCC Rules, Part 95, Subsection D, a CB may not be modified.

>That same Cb can now be used by a ham on the ham bands and that same cb
>would be completly legit... We know it is not legit on the CB band Are you
>saying that as well NO ...

How thick is your head? Perhaps when they die, some medical journal can do a study on the thickness.

FCC Rules, Part 95, Subsection D specifically says that a CB can not be modified. Plain and Simple, so NO - it CAN'T be used on the ham bands by a ham.

I don't know what else to do? I post the FCC Rules right here so all can see it in black and white, but you close your eyes and pretend it's not there. If there's an FCC rule someplace that says hams are bound by Rule 95 when using CB's, I want to see it. Please post it here and I will admit I am wrong, otherwise, the hams here need to stop trying to justify their use of illegal CB radios.

>If it is modified for 10 meter operation, it is no longer a CB radio. It is
>a 10 meter radio.
>

But it was still a CB when it was modified, making it illegal. According to the FCC Rules, Part 95, Subsection D, a CB may not be modified. It it is, it can no longer be operated. Unplug it and throw it in the scrap heap.

Hey Twist - I've got some duct tape to go with the ducting!

Sorry, couldn't resist that. I was considering posting what you did a couple of hours ago, but held off and you beat me to it. Of course, there is the ol' aurora, forward scatter, moonbounce, and whatever. Of course, sporadic-e propagation is closer to the 'skip' we usually refer to (and sometimes IS the source of that skip). Gee, meteors. Oh well, need any duct tape?

You proved nothing, except that you read into something that you want it to say, Where does it say throw it in the trash, never ever use it again forget about it, don't even strip it for parts. It does say a moded CB may not be used. When you modify the radio it now makes it a non-type accepted radio. Which of course is illegal to use on the CB band since you need to use a type accepted radio. Now this non-type accepted radio can be used on the amateur service because in the amateur rules part 97 says Hams can use non-type accepted equipment. Which so happens to be that old CB radio tuned to 28 MHz. No where in Part 95(cb rules)does it say the radio is now rendered useless it has to get put in the trash, throw it off a cliff, dismantle it, stick it under a monster truck tire. All that you have when you modify a cb RADIO IS A PIECE OF EQUIPMENT THAT CAN NO LONGER BE USED ON THE CB BAND UNLESS IT WAS RETURNED TO TYPE ACCEPTANCE. if YOU CAN'T UNDERSTAND THAT YOU ARE A MENTAL MIDGET.

Hi,

I've just ordered a Galaxy 2527 and no longer have a use for my 2950 (export) that I was using as a base. It's actually a Mirage 2950EX but they are both the same. On a scale of 1 to 10 it's a 10! I have the mounting bracket and owner manual.The power cord has been modified to accept a different type of fuse and that's it.

I also have an amp that I've been using with this rig and it smokes. I've received good reports and the amp does 200+

I would like $ 100.00 for the radio and $75.00 for the amp and would prefer to sell them as a set. You will NOT be disappointed!!!.

Thanks,
Chris

No Andy. Think Citizen Band is in the 27 MHz range of the spectrum. If the radio has been reengineered to operate elsewhere, it is no longer a CB radio. Part 95 specifies that CB radios can not be modified. That means that a radio capable of operating on the CB frequencies can not be modified. You need to take a look at Part 97. Read it very carefully. If a piece of equipment has been modified so that it no longer is capable of operating on the CB frequencies, then it is no longer a CB. A CB transceiver is by definition a transceiver which is capable of specific 27 MHz frequencies. If the radio is not capable of this, then it isn't a CB. It might look like a CB, but it isn't because it can't operate on those frequencies. If in doubt, call Riley or your local field office. This is really getting old and you are making as ass of yourself, suggesting that you are a knowledgeable ham. You aren't, and you don't know when to admit it. You know what they say--"People who think they know everything are particularly irritating to those of us who do."

Might just as well throw in my two pennies' worth. OK, a cb can't be modified. Once it is modified it is no longer authorized for use on 11 meters. That does NOT mean a ham can't change it and use in on 10 meters (or 15, 17, 12, 10, or 6 for that matter - heck, if ya got the guts, go for the gusto and put it on 160!). Yes, once modified, it is no longer type accepted; this does NOT preclude its' use by a licensed amateur operator from using it legally on amateur frequencies. Different rules apply. It would NOT be legal to use it back on 11 meters after the modification. The amateur license doesn't give the amateur special privileges in the Citizens' band. Everyone on 11 meters is subject to the same rules. They are different from the amateur rules on amateur frequencies.

Once again, I'm not a ham or a freebander. Everyone here knows this by
now.

> I am only trying to get them to realize that
>they are wrong and admit that I am right.

And you are apparently trying to do so without regard for logic. Quit
trying to make this a competitive sport.

> Someone asked me to prove it and I
>did. Now they can't accept that.

Because you have not successfully proven your point, at least not to
the satisfaction of the group.

You have said about a hundred times that, "It's plain and simple.
According to the FCC Rules, Part 95, Subsection D, a CB may not be
modified." Anything can be made "plain and simple" if you pull the
phrase out of context.

I explained the meaning of the rule you quoted, and I did it with
enough simplicity that a 3rd grader could understand it. You did not
respond. Why not?

Source record: 76152

No you didn't prove anything.

Unless something been changed very recently, the FCC can't really regulate the transmitting equipment. In this case, it's only the operation and use on the air (i.e. what can be radiated). By regulating what can be radiated, they are empowered, through the established type acceptance methodology, to place limits within the bounds of regulated radiation. The "...can't be modified..." clause you quote, interpreted under this precept, can clearly be read as - can't be modified beyond type acceptance and operated legally on the 27 MHz CB frequencies specified in part 95. If a licensed HAM modifies the equipment beyond type acceptance, it can't, under the rules, be used to radiate in the CB band but its find for anything that that HAM is licensed for.

The other point to mention is that the USA has in place a court system that actually is used to determine the interpretation of the law. For the FCC, the "law" is the Communications Act of 1934 as amended by the Telecommunications Act of 1996. With in these documents, the specific power and limits to those powers are spelled out, with a significant amount of delegation (empowerment) given to the panel that consists of a group of 5 appointed individuals referred to as the Commissioners. The FCC reports directly to the Congress and not the Executive branch. The Commission, normally with significant public (including corporate) input, establishes rules to fulfill the FCC's obligations under the CA, including implied amendments generated through the international agreements it's empowered to make/manage. Of course, the "teeth" of the law and the rules fall to the Enforcement group within the commission. This group (and the rest of the FCC), along with everything in government, is run based on funding within the approved budget. This alone interjects a very high level of politics into what would appear to be quite cut and dry - the law can clearly say one thing and the budget can clearly say so what, or, the law can say you must do this, the budget can say: here's the money to do it and/or enforce it, but the money may never be released to do it.

If you by chance you get one of those nice letters from the FCC, they can, under probable cause, take some rather harsh measures. If you believe you're OK under the law and, more importantly, can prove it to the Judge/jury, you're clean. It's just like the IRS. It is quite possible to be found completely clear, even though you went directly against an IRS rule IF the court finds that you did not violate the law. The concern one should have under these conditions is that there is a significant amount of empowerment and general delegation under the acts that set up those organizations which in general, provided them with some rather strong, effective teeth.

Mike,
Not currently a HAM but I am still a licensed GMRS operator, and, I've
got an type accepted CB.

Okay. You went to a party. You see people stanting around talking in
groups of 2, 3, 4 or more. You walk around and listen to see if anyone
is talking about anything that interests you, and butt into their
conversation. If they don't like what you have to say, they will tell
you.

While on the CB, expect people to be rude and crude. If they aren't,
great. But expect it, and don't let it bother you.

Sparky, FLRC

Don't get discouraged. When you are the new kid on the block
it is best to just listen for a while. Don't just jump in and start
transmitting and give some grumpy old timer an excuse to critique
your ignorance in transmission etiquette.

When you feel that you've caught on to how things are done then
go ahead and key up. The safest and possibly best way to communicate
without getting your head chopped off is to treat the radio like a
telephone. No jargon whatsoever. No one can complain about that.

Cb radios can be modified by any one. They just can't be used
as a transmitter afterwards.

Example:
1. purchase a CB
2. read the rules
3. ignore the rules
4. take hammer
5. make modification with hammer
6. flaunt the modified radio because without transmission it is not
illegal

Example two:
1. purchase a CB
2. read the rules
3. ignore the rules
4. take CB freq book
5. make modification for extra channels
6. don't transmit and your modification is no different than the
hammer mod

Har Har! Funny to see all the whining going on about this subject among the
illegals. Lots of lame excuses. With all the folks claiming they "listen"
to 10 meters you'd think this was a HAM WORSHIP newsgroup. But it's not.
It's illegal CBers and hams who use illegal CBs.

Fact is, the guy with the website IS a dumbass. Here's why.

1. He is a CBer.

2. His website is all about CB.

3. He posted a pointer to his website in a CB newsgroup

4. He brags on his CB website about "channel" and "power" mods to his Cobra.

5. He posts a picture of a Cobra CB sitting on a HAM 10 METER FREQUENCY.

6. He is a dink and a dumbass and no amount of lame excuses can convince
anyone that:

a) He uses it for "listening".
b) He is a ham
c) It's legal

Dumbass Award goes to dinkboy. Try again Twisty!

Again, Badabing, you are missing the point.

I just received a reply from the ARRL on this matter. I was bored, so I thought I'd ask the experts. They say that there is something in Part 2 that allows for hams to modify a CB radio and use it on another band, so long as it isn't used again on CB.

With that in mind - a non-ham can not modify a CB radio. That is plainly stated in Part 95, Subsection D of the FCC rules. :) I never said you have to throw it away. You just can so much as turn that on once you've modified it, again - unless you are a ham and modified it to work on a different band.

>as a transmitter afterwards.

Actually the FCC rules say they can't be OPERATED again. That means you can't turn it on. (Unless you are a licensed ham and have modified it to work on another band) Operating a transmitter isn't just transmitting. It's turning it on, adjusting the volume, changing the "channel"...

> Thanks for your advice,

Forget the handheld. You can purchase a cheap 40 channel AM base station
for less than $100. You should also put up a ground plane base station
antenna. For your purposes, it does not have to be very high in the air,
just mount it a bit above the rooftop. If you have a chimney, Radio Shack
sells a chimney mount that works ok. You might be able to get the complete
setup for under your $150 price tag.

Don't expect to be able to talk to him all the time during the daytime. We
are at the peak of the sunspot cycle, so distant signals coming in are
likely to override any local station that is not quite close.

Part 97 doesn't address modifying radios or using modified radios. Apparently somewhere in Part 2 is the rule that says a ham may modify a CB to operate on ham frequencies, probably not in those exact terms, but that's what the ARRL tells me.

If you take Part 95 at face value, it makes it appear that no one is authorized to modify a CB. Apparently they didn't feel they needed to make any references to other FCC rules that contradict this rule.

Even if the man can't pass the code test for the Amateur Service he sure
has the seabag lawyering bolted to the floor.

What's stated above is exactly correct... how you're interpreting it is
wrong.

Here.... read what you quoted earlier.......

> RULE 9 - Equipment
> {A} You must use an FCC type accepted CB transmitter at your CB station.
> Youcan identify an FCC type accepted transmitter by the 'type
acceptance'label
> placed on it by the manufacturer. You may examine a list of type-accepted
> equipment at any FCC Field Office or at FCC Headquarters. Use of a
transmitter
> which is not FCC type-accepted voids your authority to operate the
station.
> {B} You must not make, or have made, any internal modifications to a
> type-accepted CB transmitter. (*read Rule 25) Any internal modification to
a
> type-accepted CB transmitter cancels the type-acceptance, and use of such
a
> transmitter voids your authority to operate the station.

If you operate a CB station, all gear must be type-accepted and non-modified
to conform to regs... as you stated earlier. The difference is that Hams
can operate non-type-accepted equipment... ON the ham bands. We're not
talking about using a modified CB on the CB band. Your authority to use it
on the CB band is what's voided... the modded radio is no longer legal or
usable on the CB band, but as long as it's within FCC technical specs for
Amateur use, it's perfectly legal on the Ham bands.

>in Part 95, Subsection D of the FCC rules. :)

And again, VHF, you have no idea of what you are talking about because
you still can't read the rule you quoted. It says that the operator of
a CB station cannot internally modify the transmitter for that
station. It does NOT "plainly state" anything about a "non-ham". In
fact, it "plainly states" that the operator cannot use a transmitter
modified by himself or anyone else, ham or not.

>on, adjusting the volume, changing the "channel"...

If you read your own quote you will see that a modified 'transmitter'
cannot be operated in a CB station. If you read the section of code
concerning intentional radiators, you will find that the definition
for "operation" means an intentional radiator actually radiating.
That's not too easy to do unless you key the mic (or if your radio is
really on the fritz).

Here it is, plain and simple:

If you want to argue FCC rules you will lose, because a lot of these
people have been playing this game since long before you were born. If
you want to muck things up with fallacies of logic, you will lose
there too -- I have had the privilege of teaching the course (so far,
the only foundation of your argument has been a 'confusion of absolute
and qualified statements'). Not only that, but I have pointed out two
of your 'untruths'. Care to make it three? Or would you rather just
read those regulations again and come back when you can understand
them?

It seems that VHFRADIOBUFF did some research and found he was wrong about hams modifying CB radios for use on ham bands. He acted like a jerk who was ignorant of the rules. The great thing about ignorance is it can be changes by knowledge, unlike the stupidity of Twistie Tweaker. VHF RADIO BUFF admitted he was wrong like a man and I can respect that. He admitted he was wrong, thus showing that he is not braindead as some people implied. In my opinion that part of this thread is over and done with.
Twistie Tweaker on the other hand is another story. If I remember correctly in his last post for #5 he still called the radio in question a CB. I do not dispute that the guy who posted the site is a CB user whose site has to do with modifying CB radios and other illegal activities. That does not change the fact that the radio in the picture with the frequency counter sitting on 29.whatever Mhz is still a Cobra 148 DX+ HAM radio. Just because the radio says Cobra on the faceplate doesn't mean it is a CB. That picture came from Cobra Electronics and they are the ones that put their ham radio on a ham frequency for their picture.
Twistie, before you go saying shit about Twistedhed and the other illegals sticking together when MY post is the one he quoted and you were referring to, you better get your shit straight. You will not find one post in this newsgroup from me under this screen name or any other name that I have used over the last 2 1/2 years here that supports illegal activities. I may do that stuff or I may not, who knows? You sure as fuck don't. I support whoever is right on whatever the point they are trying to make. Whatever those guys do on their spare time is none of my damn business or yours. If they get busted for their activities then they will face the consequences and they all know it. What good does telling someone they are illegal do when they already know it? Are you so full of yourself that you think they will forget if you don't remind them? Just don't go lumping me with people you dislike for no reason. If I ever give you a reason to put me in that group then I am fair game and I will accept that. Until I do, shut the fuck up and leave me alone. Also, if you see me write something that is not entirely accurate, call me on it. I can admit when I am wrong because I am willing to learn. Isn't that the purpose of this NG? Are you man enough to admit when you are wrong? If you ever show some common sense I may even take you out of my kill file but I'm not holding my breath.

Greetings!

Viewing the description of the radio at www.cobraelectronics.com, I
believe you'd like the RF Gain control flexibility the Uniden 520 will
provide you.

At least you'd be able to reduce the noise and adjust receiver
sensitivity to make the trips more enjoyable.

It's a little more for the Uniden, but you also get a proven chassis
design that has lasted throughout the years. Decades, really.

The Cobra 19 has come in a variety of flavors and different
manufacturing site origins. Cobra 19, in the +, Ultra, DX, DX II,
Ultra II - mostly cosmetic changes and as of 1994, a major
restructuring of the chassis to a cheaper method that uses modular
designs.

Before 1994, they were made in the Philippines but after 1994, they
were made...who knows where??? Mostly China and Malaysia.

Take the Uniden over the Cobra...IMO.
This will pose problems for many environments that are harsh on both
the driver and anything in the vehicle, bumps and potholes come to
mind.

On Thu, 22 Mar 2001 16:40:16 -0500, while the modem was ice fishing

Hams with an advanced license can modify, build or convert any radio for use in the ham bands. The problem with CB is that most HF Ham Radios with the flip of a switch will transmit in the CB band with no problem. The Yasue FT-101 was built with 80 watts out and CB built in, back in the 1970s. Most of the new rigs have matching amps that will go 2000 watts rock solid in the middle of the 11 meter/CB band. Why modify when you can buy it from out of a store?

I have ham radios that are capable of going beyond the legal band edges.
This is not a problem, because in the FCC's eyes, a ham operator has
technical knowlege and has responsibility to know where he is operating,
and will be cited if he is found to be outside of his legal bands. This
is in contrast to radio services (like CB) that require type accepted
radios. Type accepted radios are required in radio services where
technical knowlege is not required, so the radio is built so that there
would be no way (outside of opening the case) for the operator to be out
of band or at illegal power levels. The responsibility for tyechnical
conformity in this case lies in the type acceptance of the radio. See
the difference?

Your import Icom was probably not approved by the FCC for spectral
purity reasons. Many radios made for the international market do not
meet the FCC's Part 15 emission requirements, or the transmitters
spurious output exceeds the specifications.

You are reading the rule too literally. Modification is not allowed IF
THE RADIO IS TO CONTINUE TO BE USED ON THE CB BAND. This does not apply
if the radio is to be converted to another service, where type
acceptance is not required. Tell me, from the FCC's standpoint, what
would be the difference between a radio, that I hand crafted from parts,
to be used on the ham band, and a radio that I made from a converted CB?

> Still wrong.

No. You will find ads in the pages of most Ham magazines for plans to
convert CB's to Ham frequencies. It's done all the time, and the FCC has
absolutely zero problems with the practice. If you still don't believe it
then contact the FCC for yourself, otherwise your wasting my time telling
you what almost every experienced Ham already knows as fact.

Again, Badabing, you are missing the point.
I just received a reply from the ARRL on this matter. I was bored, so I thought I'd ask the experts.

Well, that's a problem in and of itself, and isn't even really relevant. We don't all consider the ARRL experts, not by a long shot.

They say that there is something in Part 2 that allows for hams to modify a CB radio and use it on another band, so long as it isn't used again on CB.

No kidding? Sounds like this is where you switched your position. Guess you had to hear what we all knew from the "experts". I knew that. Lots of us did. And guess what? We ain't all hammies. No problem. Everyone goofs.

With that in mind - a non-ham can not modify a CB radio.

THIS, was not the issue. Never was.

That is plainly stated in Part 95, Subsection D of the FCC rules. :) I never said you have to throw it away. You just can so much as turn that on once you've modified it, again - unless you are a ham and modified it to work on a different band.

Concedement accepted.

To expand a bit further. Once it is modified, it is no longer a CB
radio, and is no longer covered by the Part 95 CB regulations.

>operator cannot use a transmitter
>modified by himself or anyone else, ham or not.

That's EXACTLY what I have been saying. Thank you for confirming that. However, as I've posted, according to the ARRL, there is a section of Part 2 that allows Hams to modify a CB.

>> I never said you have to throw it
>>away.
>

Throwing it in the junk box doesn't mean throw it away. You could always use the screws, maybe even the knobs or some small internal components to repair another CB.

If you read Part 95

Why? Part 95 has nothing to with ten meter radios.

and are not aware of the section of Part 2 that allow hams to modify a CB, then Part 95 appears to "lay down the law".

It does "lay down the law". Just not for ten meter radios. So once again, part 95 is irrelevant.

Part 95 rules apply to radios being used on the CB band. Any radios
being used on the 11 meter band must be type accepted. Any
modifications made to the radio's TRANSMITTER section voids the
type-acceptance status and that radio may no longer be used on the CB
frequencies. It MAY, however, be used in radio services where
type-acceptance of equipment is not required (as in Amateur), and if
the radio meets spurious emission standards for the frequencies on
which it is being operated. Therefore, a 10 meter rig modified to
transmit on CB frequencies is not type accepted and therefore not
legal for use on the 11 meter band. A CB modified to operate on the
28 MHz band is no longer type accepted for the 11 meter band and may
not be used in the CB service, but if it is operated by a holder of a
valid amateur radio license authorized to operate on 10 meters, the
radio MAY be used, as long as the spurious emissions are at least 40
dB (I think it's 40) below the strength of the signal being
transmitted on the primary operating frequency. If your list of
callsigns is valid, you should know that one of the basic principles
of the amateur radio service is EXPERIMENTATION - which inherently
involves the modification of equipment - sometimes even old CB's...

WRONG. According to Part 95, a radio being USED on the CB frequencies
is not to be modified if it to continue to be used on the CB
freqencies. Part 95 does not address the legality of modifying the
radio, it addresses the USAGE of a radio that has been modified.

>on, adjusting the volume, changing the "channel"...

The rules say that the TRANSMITTER may not be operated. Nothing in
the rules about modifications ot the RECEIVER. Since a typical
TRANSmitter/recEIVER (hence the term TRANSCIEVER) actually containes a
RECEIVING section and a TRANSMITTING section they can be (and usually
ARE, by intelligent beings) considered to be seperate entities.
Modification of the RECEIVER for out of band operation does NOTHING to
the type-acceptance of the CB radio (read YOUR copy of the rules
VHFbuddy). Modified RECEIVERS can be operated anywhere and by anyone.
Hell, if you can modify a NON-scanning CB to receive cell-phone
frequencies, that's LEGAL (only scanning radios that receive
cell-phone frequencies are regulated, not NON-scanning radios).
Modification to the TRANSMITTER section of the radio will void the
type acceptance, and the TRANSMITTER may not be operated on the CB
frequencies. Read it VHFbuddy - it's in the rules....

I address this to the guys defending the ownership of ham rigs by non-hams.

You are first class idiots.

The crap made by RCI, Cobra, Galaxy, and all the rest are **CB RIGS** designed to appeal to YOU, the ILLEGAL CBER who routinely ignore FCC law.

Who do you think yer foolin when you claim you "only listen" or "never transmit" with these rigs? No one.

Yet you persist in taking up bandwidth with arcane arguments about FCC chapter and verse. Please..read this sentence below:

The FCC regs are not intended to be LOOPHOLES BY WHICH ONE CAN PURSUE ILLEGAL ACTIVITY.

They are clearly designed to enforce the rule that unlicensed yahoos shall not use anything but stock CB rigs on 11 meters.

(PS: The fact that there are actual licensed hams engaging in illegal activity is no excuse for ANYONE to follow suit)

Greetings!

Following Sparkys lead, if you listen, and I can't stress that enough, Listen to the topics being discussed. Be ready to shift gears in the train of thoughts. It's a BIG cafeteria out there!

If you wish to participate, usually you "break in" on the channel. It's hard to answer that without being in the same area to listen to the conversations at hand. Each channel has it's own "group" of people and as the fur flies, so does the laughter. Many people kid around a lot just to relieve stress and humor others. Be ready to get [FWIW] knocked around a bit until they get to know you.

If not too many people are "hot" on their radios - keying up too quickly, you might be heard so you can get acknowledged and allowed to make a comment or two.

It's easier to "flow" with the current than go against it. So, be ready to receive a wide variety of different comments. Every section of the country, whether USA, UK, Asia, or Africa - or anything in-between, has their own conduct and dialect. So, when dealing with the natives, be willing to participate in their styles.

Once you get the hang of how people in your area conduct themselves, you are ready to begin building your own style that makes you different from the others and can be identified by your own conduct.

If all you want to do is agitate [make people mad or upset] or cause H & D [Hate and discontent] - you may want to reconsider taking up telemarketing. That is by far the most popular means to get someone mad and still get paid for it. ;-)

The best way to learn the ropes, is to listen to how others conduct themselves and work accordingly - that is the best way to describe it.

Soon, and you have to understand this, you'll develop your own style and methods of communication - it's simply a process of development in communication skills.

If you show respect, you might get it in return - no guarantees. But, if you don't take the radio seriously [it's entertainment for millions] you can make friends even though it may not seem like it. People use CB for communication, if you take the time to consider their needs, you will help others and without knowing it, get some recognition from others whom simply listen.

I hope you like coffee, because you might get stuck with picking up the tab at a local restaurant. Why? Because anyone and everyone that wishes to make a good impression, will have to give of themselves to the "group" in order for the group to recognize the efforts.

It can pay you back substantially in dividends, like mods, radio setups, local network of techs, antennas, radios - I hope you're interested in electronics because thats what they get together and talk about all night.

Breaking the ice is the hardest part, but you have to let them know you're out there...

If you need help, we'll try and answer those questions.

Awww, did the big, bad cber's hurt your feewings? Awww you poor,
anonymous (ha) thing you.

I address this to the guys defending the ownership of ham rigs by
non-hams.

So far, so good.

You are first class idiots.

There you go. Shot your woad wight off the bat. But thats ok. The big
bad peoples never did wike you because we wealize what you are.

The crap made by RCI, Cobra, Galaxy, and all the rest are **CB RIGS**
designed to appeal to YOU, the ILLEGAL CBER who routinely ignore FCC
law.

And it so much fun making you cwy about it.

Who do you think yer foolin when you claim you "only listen" or "never
transmit" with these rigs? No one

Never claimed it once. Your an ez tawget 'cause of your wies!

Yet you

Aww, but mommy, mommy, he...
mommy, mommy, they....
BUT mommy, mommy, mommy, waaaaaaaaa
Ahahahahahahahahahaahahaahaaahaha!

persist in taking up bandwidth with arcane arguments about FCC chapter
and verse.

Awww does this hurt your feewings, too? Good. Wike you are one to
comment on what is posted. Nyuknyuknyuk!

Please..read this sentence below:
The FCC regs are not intended to be LOOPHOLES BY WHICH ONE CAN PURSUE
ILLEGAL ACTIVITY.

Awww, cooochiecoochiecoo...afwaid of your own wules? Ahahahahahha!
Tough. Cwy for me, baby! Don't like the wules wittle baby? Petition the
FCC who you said was gonna get us all to change the wulings you don't
wike! Ahahahahaha! Until then, feel free to continue paying homeage to
me.

They are clearly designed to enforce the rule that unlicensed yahoos
shall not use anything but stock CB rigs on 11 meters.

Hewe is where I get to say a big, "Scwew you" with a huge smile on my face. Your interpwetations are folly for us all. You can't even contwol your own bwadder and you want to contwol evewything else.
Waaaaaaaaa! Mommy, Bad man found a way to do it wegally. Waaaa!
HAhahahaha!

(PS: The fact that there are actual licensed hams engaging

in villifying your ignowant soul would be clue enough for any one, but not you. Waaaaaaa..Mommeeeeeeeeeeeeee! Ahahahah!

in illegal activity is no excuse for ANYONE to follow suit)

Aww, did the big, bad cber's swap you and make you cwy? Poor, poor, anonymous, nobody, cwybaby..ahahahahahah!
Now say something stupid for the masses. Better yet, forge me. I think you wost the gonads to forge me. MOMMMMMMMEEEEEEEEEEE!

You bet. People seem to be much more polite on SSB (in general) and
slang is minimized. It is less like a party and more like a telephone
conversation. You might want to check into any local SSB clubs in your
area.

Just a few questions here. Did you have any problems with any of the big PLC manufactures over IP rights? I can imagine them getting their shorts in a twist over you hacking in to their "proprietary" equipment. Some companies even try covering their behinds buy spelling out in the usage agreements that there will be no reverse engineering of hardware, and software. Then the final bug-a-boo, if the machine crashes because the PLC program got mucked up, they disclaim any responsibility for damages because non approved software, and or hardware was used to program the PLC. So what are your thoughts on those issues? And if they are an issue how did you, or how are you, going to work around them?

Well, let's see. You say that you "know 1 or 2 things about ham
radio", and then come off in the ng saying that everyone else is
thickheaded. Does that help to illuminate the picture?

>>Your quote came here with your own narrow interpretation, and you

It seems there are quite a few people here that are not familiar with
Part 2, but are very familiar with Parts 95 and 97. These same people
have understood the rule correctly.

BTW, Part 2 has many sections about equipment certification and
modification, including a couple regarding ham radio. You might want
to read these rules and see which ones pertain to CB radios as well.
In fact, start at the beginning of Title 47 and learn the structure of
the code and the basics of the law before you start jabbering about an
area where you have no understanding. The fact is that I, being a
non-ham, can modify a cow chip to transmit on any authorized
frequency, provided I have the FCC's authorization to do so. And along
the same track, I can modify a CB radio for use on the CB band
provided I get it re-certified. Kinda blows your "can't be modified.
period." theory all to hell, doesn't it?

Sparky I have brought up some of your same points what happens to a radio
that was modified, tweaked,peaked, and now the owner of the radio would like
to have it put back to "original " for use on the CB band. Andy makes it
seem you have to either, hide in a secret room while fixing it and/or
don't get caught restoring the radio for fear of the death penalty being
handed out if you are caught.

Hi all, Some one just gave me an old pierce simpson radio, actually 2, I am wondering, does anyone know where I can get info on these radios? I have the Pussy cat base, and the tiger mobles, 2 of them, I need the mic pin out, they are a 4 pin mic but what I get for pins is too strange to be right, and any other info on the radios would be greatly apreciated. I would like to get these bad boys working because I know me I won't throw them out like I should. Any info is greatly apreciated.
Feel free to email f4racer@netzero.net if you can help.

By some people's figuring a business band GE radio that's converted to
be a 2M repeater isn't legal for use on 2M. I wonder how many hundred
repeaters that would take off the air? Wile the biz band radio
wouldn't be type accepted for use as a biz band radio once it's
converted it could be used in the ham bands. This also applies to 11M
radios that are converted to 10M use.

1822. TRC-485 Channel Expansion?? This could be it!

Newsgroup: rec.radio.cb
Date: 2001-03-23 23:59:59 UTC
From: Todd Bainbridge <tbainb1424@prodigy.net>
Message-ID: <3ABBE37E.894EF2A6@prodigy.net>
Source record: 76394

I've found what I believe is the channel expansion mod for the TRC-485,
but it seems to be in spanish, and the grammar doesn't translate very
well. Can anyone provide this mod in clear english? This is what I have.
Much Thanks!

Acerca del comentario escrito en una pagina de internet
para incrementar cantidad de canales de su equipo
Dragon TRC-485 o Radio Shack TRC-485 que originalmente
cuenta con
40 canales desde 26.965 hasta 27.405 en los modos AM -
USB - LSB
es levantar el Pin del microprocesador(Dragon
TRC-485 =
SY201) 80 pines
(Radio Shack TRC
485 = HYU4011Q-
06 FP) 80 pines
desde el Pin 31(open),32(open),33(open),34(close).-
quedara con 400 canales de transmision/recepcion.
despues conectar un (1) pulsador (Touch) en el pin 29
(mode) del CPU
(CPU SYS 201) con el pin 3 del CPU o conectarlo con la
pata de la
tecla
Touch NB (noise blanker) en el panel frontal (Main
PCB) al lado de
la
resistencia de montaje superficial R221 (103 o 10K)
al pulsarlo pasara a los diferentes modos de
transmision.
A 25.165 - 25.605
B 25.615 - 26.055
C 26.065 - 26.505
D 26.515 - 26.955
(Blank) 27.965 - 27.405
F 27.415 - 27.855
G 27.865 - 28.305
H 28.315 - 28.755
I 28.765 - 29.205
J 29.215 - 29.655

Para transmitir/recibir en todos los 400 canales hay
que ajustar el
VCO
tratar de usar un tester digital para medir la

continuidad desde el
pin 3(K12) del CPU
a la pata del Touch NB.
los pines 2(k13),3(k12),4(k11),5(K10) son entradas de
datos del CPU
en conjunto con los pines
27(k03),28(K02),29(K01)

>

Knowing 1 or 2 things about ham radio is not the same thing as saying that I am a knowledgable ham. As a matter of fact, all I did was memorize questions and answers to pass the test. I have learned some stuff in the years I've been a ham though.

Ah, no. This isn't mucking in someone's proprietary stuff. That is spelled out pretty clearly and yes, you would be correct - what happens IF. No, this is simply the computer generation of ASCII code which the PLC software can read. You can save 'routines' to be re-used. These are saved in ascii, which opens the door to letting another program generate the ascii text. At this point, the program purchased from the vendor simply reads in the routine (which happens to be the whole program, including slot allocations). The key is to use the PC program to generate CLEAN EFFICIENT code which is essentially self-documenting. If it stops, you don't need documentation. It will stop at one point, generating a specific message (which needn't be done if you are looking at the ladder in real time) which is NOT ambiguous. An example that comes to mind (of good code) is the use of a single timer and counter to count seconds rather than chaining counters and timers to count seconds, minutes, hours, and days. Just send a number - the computer can figure it out - but only when a human being has to read a report. Otherwise, you choke up the network with lots of integers and waste disk space. We had one unit collecting data which digitized in 15 microsecond intervals. Pass was 7 to 15 milliseconds, over 30 was a time-out. Would you believe converting to DOUBLE PRECISION floating point and sending it over the network and storing it as such? A single integer can store a count from zero to 2000 (for that application) very nicely without loosing any precision. These are minimal examples. The ladder logic gets worse. Much worse. Back to the proprietary information - I almost mucked with the TI controllers back in 1980. The data would have had to been serialized at a 1 mb rate - quite a lot in those days, so I started generating the tones directly on tape to load into the machines (yup, they used cassettes back then). I was able to get some data into the machines, but started worrying about what you mentioned. I simply used a (purchased from TI) data link and fed the trash-80 into that. From no code to 3 almost working stations in 15 minutes. It took about 2 minutes to debug. Someone wired a couple of switches in backwards. In short, no mucking with proprietary information. I am certain it could be done, but only with their permission and a lot of legalease spelling out their rights and what they would receive as well as being protected from errors committed by someone else. Simple ascii is all. The generated ladder would, of course, be subjected to an OEM lock. I had a short demo of a data collection system. Their system took several seconds to respond. On mine, you couldn't see any delay from when you threw a switch or the machine switched states - the screen responded instantly - to a total of 14 running stations. What did they say? Gee ... can you take the 'noise' out? Look, gang - define 'noise'. Give me a detailed description of what you want to respond to. Oh well. Their system works. Often. After 2 years, we are once again writing down numbers by hand since they don't entirely trust the data collection. Hey, I can live with that. One guy asked why I was totally disconnecting a machine before getting into

it. I told him I did NOT trust the ladders. These things, if thrown into clear, do NOT always clear - if they can't see something they want, they will kind of clear, yet wait for a signal. When it arrives, cylinders move with well over 100 pounds of force (to move a 1 oz part!). We had one guy receive 14 stitches in his had when another machine indexed - 10 seconds after being put in STOP! I warned them about the e-stops. Then they wanted me to 'fix' it. Sure, but all new relays (there ARE regulations concerning this). Needless to say, it got some folks real upset and so they had someone else fix it. In software. It was shortly thereafter that the aforementioned individual received the gash requiring 14 stitches. It is simple - for 400 production people on the floor (assemblers, handlers, mechanics, and 1st line supervisors) we have over 400 offices. Yup, I'm exaggerating. It could never be like that. Of course. Only in America.

Unfortunately, the transmitter and receiver share many common components. Oscillators, for one. While you might modify the receiver, you would have to run tests to ensure the transmitter section was working properly (are your injection levels correct?). These tests imply large reports to the FCC of radiated (and conducted) emission. In essence, you are applying for type acceptance. You could likely sell a CB transceiver with virtually unlimited receive. You'd just have to convince Charlie that it would be difficult or impossible to modify the transmit section. By applying the 'golden screwdriver', you have ensured not being able to guarantee the transmitter without aforementioned testing. Ie; illegal without going through the type acceptance thing. You don't wanna try. A typical receiver used for some of the tests will set you back more than a Porsche. Calibration alone (every year) will cost thousands, not hundreds. You will need an open area test site (OATS), calibrated antennas, the aforementioned receiving apparatus - oh yes, plotting equipment. You will have to plot the emissions of your rig, both conducted (low frequencies, from kilohertz to a megahertz or so) emissions and radiated emissions (from below 11 meters to over 1 gigahertz) as well as the output of the transmitting section to ensure compliance. The reports are fairly involved. I know, I used to write 'em (but not for transmitters). You are aware that there are radiated emission standards even for receivers (scanners, etc), right?

You are kidding, right? If a radio is restored to its original
condition then that would be a 'repair', which, according to the FCC,
is perfectly legal. The transmitter is no longer modified, and works
according to the specifications reported to the FCC by the
manufacterer when it was certified or type-accepted. Both you and VHF
should read Part 2 before wading in any deeper. Part 15 wouldn't hurt,
either.

How about an apology for calling everyone here "thick headed", and
acting like a pompus ass?

I once read that the earth is flat, but that doesn't mean I am going
to preach to others like it was gospel. Perhaps next time you should
ask questions with the assumption that you don't know half of what you
think you do, instead of running off at the mouth and finding out you
don't know squat.

As long as the ham is operating on the cb channels, he is bound by Part 95, but he can legally modify a cb radio for operation on 10 meters and use it there, but the radio is now no longer type certified for cb and cannot legally be used on cb channels. The meaning of the rule is, it is illegal to modify a cb radio for use on the cb channels, or any other frequencies, except the ham bands by a licensed ham. That should be obvious to the most casual observer.

VHFRadioBuff wrote:

Once it is modified it is illegal for use on the cb band, but not for use on the ham bands, what a dumb ass.

I think this string is funny.
If any of you that are hams and you hear a 2/10 repeater from Cranbrook BC Canada around 28.600 Mhz USB, that is an old Johnson CB modified and a 500 watt boot for the 10 meter portion. I do believe that the call is VE7-CAP owned and operated by the East Kootney Ham Radio club, (VE7-IP). This was installed with the help of the radio inspectors and is only about 100 feet from the police repeater system on mount Baker in the south east corner of BC Canada. This 2/10 repeater has been up and going for 10 years all legal. Canada and the US have many of the same laws in regards to radio and I can't see this being any different. I am embarrassed to be a ham and in the same category as vhf radio buff. I am also an avid Chicken Bander for the fun of it.

Hello.

I am a fairly total newbie to CB and Amateur radio. I am interested in both, but CB seems to be the simpler one to start with. (plus you dont need a license)

Are there any real good newbie-guides out there, or any good (free) reading materials on the web?

Also, what kinda range can I expect from various styles of units, and how much power should be behind one for it to work effectively?

What brand names would you suggest? I'm on a bit of a budget.

My ultimate goal would be a mobile unit (car mounted is fine) that can get me about a 20 mile transmit range. Is that possible with CB?

Thanks in advance!

I don't know what the equivalent is down in the US but in Canada it is the Advanced class. They are the only ones that can operate home-brew or modified radios the Basic class must operate store bought ham gear. The people with the basic license, (I think it is the US Technician class equivalent) can't modify transmitters or run over 250 watts. I imagine that the rules are close to the same for you boys down south.

> not Ham.

No, as I understand the rules, a ham is not permitted to modify a type-accepted radio. Once a device has type-acceptance certification, you are not permitted to touch the insides. For proof of this, simply look at the FCC rules.

According to section 95.607 (see below), only a person with a grant of authorization can make modifications under the terms of the type-acceptance certification (the "terms of certification" mentioned in this sentence are the technical requirements described in part 2). And before a grantee can modify a type-accepted radio to add frequencies, increase modulation, or increase RF power output, the grantee must obtain prior written permission from the FCC. Since a ham operator is not a grantee, the ham operator cannot modify the radio even to add frequencies so that it may be used in the ham bands.

Likewise, according to section 95.424 (see below), only a person "certified as technically qualified to perform transmitter maintenance and repair duties" can make internal repairs or internal adjustments to a CB. Therefore, unless that ham operator has been "certified as technically qualified," that ham operator cannot make "internal repairs or internal adjustments," which would include internal adjustments to change frequency coverage.

I should also point out, since this is so often misunderstood, there is absolutely nothing in either of these rules that provides an exception for ham operators. Ham operators are bound by these rules just like everyone else.

Dwight Stewart (W5NET)

http://www.qsl.net/w5net

TITLE 47, PART 95, Subpart E--Technical Regulations

Sec. 95.607 CB transmitter modification.

Only the holder of the grant of authorization of the particular certificated CB transmitter may make the modifications permitted under the

provisions for certification (see part 2 of this chapter). No grantee shall make any of the following modifications to the transmitter without prior written permission from the FCC (Federal Communications Commission):
(a) The addition of any accessory or device not specified in the application for certification and authorized by the FCC in granting the certification;
(b) The addition of any switch, control or external connection;
(c) Any modification to provide for additional transmitting frequencies, increased modulation level, a different form of modulation, or increased TP (RF transmitter power expressed in W (watts), either mean power (TP averaged over at least 30 cycles of the lowest modulating frequency, typically 0.1 seconds at maximum power) or peak envelope power (TP averaged during 1 RF cycle at the highest crest of the modulation envelope), as measured at the transmitter output antenna terminals.)

[53 FR 36789, Sept. 22, 1988, as amended at 63 FR 36610, July 7, 1998]

Subpart D--Citizens Band (CB) Radio Service

Sec. 95.424 (CB Rule 24) How do I have my CB station transmitter serviced?

(a) You may adjust an antenna to your CB transmitter and you may make radio checks. (A radio check means a one way transmission for a short time in order to test the transmitter.)
(b) You are responsible for the proper operation of the station at all times and are expected to provide for observations, servicing and maintenance as often as may be necessary to ensure proper operation. You must have all internal repairs or internal adjustments to your CB transmitter made in accordance with the Technical Regulations (see subpart E). The internal repairs or internal adjustments should be performed by or under the immediate supervision and responsibility of a person certified as technically qualified to perform transmitter maintenance and repair duties in the private land mobile services and fixed services by an organization or committee representative of users in those services.
(c) Except as provided in paragraph (d) of this section, each internal repair and each internal adjustment of a CB transmitter in which signals are transmitted must be made using a nonradiating (``dummy'') antenna.
(d) Brief test signals (signals not longer than one minute during any five minute period) using a radiating antenna may be transmitted in order to:
(1) Adjust an antenna to a transmitter;
(2) Detect or measure radiation of energy other than the intended signal; or
(3) Tune a receiver to your CB transmitter.

> to a CB transceiver being operated in
> the CB band. [snip]

Perhaps I missed something, Jerry. Can you show me where it says there is an exception for ham operators?

Remember, when you start taking the screws off to modify that CB radio, that is a CB radio (not a ham radio). Therefore, at this point, all CB related rules apply (not ham radio rules). And those rules specifically ban internal modifications by anyone not certified.

According to section 95.424 (see below), _ONLY_ a person "certified as technically qualified to perform transmitter maintenance and repair duties" can make internal repairs or internal adjustments to a CB. Therefore, unless that ham operator has been "certified as technically qualified," that ham operator cannot make "internal repairs or internal adjustments," which would include internal adjustments to change frequency coverage. There is nothing in this section that provides an exception for ham operators.

By the way, also note my response to Cap'n Crunch for still one other rule that suggests a CB cannot be modified by a ham (Sec. 95.607 CB transmitter modification). This section would even prevent a person that was "certified" from modifying a CB (not a person with a grant of authorization or prior written permission from the FCC).

> the need for type acceptance.

According to section 95.607 (see below), only a person with a grant of authorization can make modifications under the terms of the type-acceptance certification (the "terms of certification" mentioned in this sentence are the technical requirements described in part 2). And before a grantee can modify a type-accepted radio to add frequencies, increase modulation, or increase RF power output, the grantee must obtain prior written permission from the FCC. Since a ham operator is not a grantee, the ham operator cannot modify a type-accepted radio, even to add frequencies so that it may be used in the ham bands. There is nothing in section 95.607 that provides an exception for ham operators.

For more reasons why a ham cannot modify a CB, also see section 95.424.

Dwight Stewart (W5NET)

http://www.qsl.net/w5net

Sec. 95.607 CB transmitter modification.

Only the holder of the grant of authorization of the particular certificated CB transmitter may make the modifications permitted under the provisions for certification (see part 2 of this chapter). No grantee shall make any of the following modifications to the transmitter without prior written permission from the FCC (Federal Communications Commission):
(a) The addition of any accessory or device not specified in the application for certification and authorized by the FCC in granting the certification;
(b) The addition of any switch, control or external connection;
(c) Any modification to provide for additional transmitting frequencies, increased modulation level, a different form of modulation, or increased TP (RF transmitter power expressed in W (watts), either mean power (TP averaged over at least 30 cycles of the lowest modulating frequency, typically 0.1 seconds at maximum power) or peak envelope power (TP averaged during 1 RF cycle at the highest crest of the modulation envelope), as measured at the transmitter output antenna terminals.)

> radios can not be modified.

No, you're missing the point, Gary. Before that radio can be "reengineered to operate elsewhere," a CB radio has to be opened up and modified (not a ham radio - a CB radio). And it is absolutely against FCC rules to modify a CB radio, and there is no exception in those rules for ham operators.

It doesn't matter what the radio will be after you modify it - the only thing that matters is what that radio is when you modify it. When you take those screws off, and you twist one variable resister (or touch it with a soldering tool), you have violated FCC rules - you have modified a CB radio.

And if the FCC later finds you using that illegally modified CB radio in the ham bands, you can probably kiss your license good-bye.

My radio is getting real hot when i turn my box on. I put the swr meter inline before the box and the swrs are 2.5. Then i put the meter after the box and they are flat. I just sank 4 2879s in my box when before it had mrf492s, I rewrapped the divider and combiner with the proper length and wraps, Someone told me i had to rework the matching circut! The only thing i can think that is is what i call the imput circut, it has the input wire from the relay to the board and then goes to this donut looking thing standing on its side, then it has 2 bare wires split on one end and wrapped 6 times and then comes back to one. there is also one on the output side after the trimmer cap but it is much smaller. does this have anything to do do with the swrs? Or what could it be?????? please help!!! sorry about the spelling im dead tired and in a hurry. Thanks for any help! PS. I was told this box was like the old grey 300, all the pills are in a line!

Oh man... you just shot yourself in the foot.

Question? How can you proceed to interpret the Reg's as a Amateur Radio Operator when all you did was "...memorize questions and answers to pass the test?" You have not made a valid point of your argument since you started this thread. Your reasoning is moot and should be saved for the killfile.

This argument has been going on for years (even within the ARRL), and I strongly suspect the person you talked to is wrong. Did he provide you with the section in Part 2 that applies? If not, he was probably talking about sections 2.1043 and 2.1060 (people with this position often quote these sections). If so, neither of these sections, or the sections mentioned in these sections, provide any authority to modify CB equipment.

I'd love to be proven wrong (and admit I'm wrong in this newsgroup), but so far nobody has been able to provide a single regulation that does that. And that is what we have to go on - the regulations.

For sale is this RCI-2950 from a recent ham radio estate sale. Please check out the pictures. Radio receives great and power output in SSB shown on power meter. Nice overall condition, No mobile bracket or operating instructions. Played around with it, looks OK. Display looks funny due to flash from camera, it is FINE!! Buyer pay's shipping of $14.00 UPS in the USA. Microphone is an ASTATIC mike with tone control on side. I am guessing but I think that this is not the original microphone but works great. Radio was tested and listened to on another radio, SSB is loud and clear, AM fine etc...
This is my reference link so you know who you are purchasing it from!
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=rlonn@home.com
PayPal or BidPay will work for me. USPS Money order or cashiers check is fine.

OK, I see what you did. You simply designed a text based program to generate the ladder logic in text format, then let the vendor's PLC program perform the text to PLC specific code translation, and load the resulting code in to the PLC. Is that right?

> The key is to use the PC program to generate CLEAN EFFICIENT code which is
> essentially self-documenting. If it stops, you don't need documentation.

You should see the programs some of our guys write, 700 + pages long! I can't see how anybody is going to understand a program that size. I'm glad I just do the power supply design work. I don't feel like spending my weekends trying to debug PLC programs that size. I got better things to do with my time.

> It will stop at one point, generating a specific message (which needn't be

I can tell you some stories about the old AB PLC2's and 3's timers. They had some interesting quirks to them. I remember that from my old field service days.

The servo controllers for motors were the pits. You would not believe how buggy those early modules were. They were a pain in the rear to program too, when you could get them to work that is.

Then there are the pull up resistors need for the soild state proximity sensors. Some worked with the input modules, and some didn't no matter what

you tried. Give me a few more minutes I can come up with more "Fun with PLCs" stories.

We never got in to any data collection applications using PLC's like that. At most what the customer really wanted to know was the number of machine cycles run, number of parts passed, number of parts rejected, and machine up time.

Yeah, I don't know what kind of "sanity check" the PLC does with the code fed in to it by the programmer. I wouldn't be surprised if there was no check at all. It's better not to even risk it.

> this).

The relays are supposed to kill all power to the I/O racks, AND to all external switches, lamps, valves, etc. That's the purpose of an E-Stop switch. You NEVER do this in software. You should also use double detented valves too. These valve types require power to be supplied to either side to get the valve to switch. The spring return types cause the machine to do strange things at power off, or when the "Master Start" is pressed. The whole point of a safe design is the machine should NEVER move UNLESS a button is pressed to specifically cause motion.

> Needless to say, it got some folks real upset and so they had
> someone else fix it. In software. It was shortly thereafter that the

That was a BIG No-No! A software fix to prevent an injury is not safe.

Sounds like your place is like mine. The ship date is all that matters in the end. After that it's a "field service" problem. Mean while the poor engineers are trying to catch up with the new work piling up on their desks, and don't even want to think about spending any more time on the equipment shipped out the door because they don't have the time.

Here you go. Some paragraphs deleted for bandwidth.

==========
Sec. 2.932 Modification of equipment.

(a) A new application for an equipment authorization shall be
filed
whenever there is a change in the design, circuitry or construction of

an equipment or device for which an equipment authorization has been
issued, except as provided in paragraphs (b) through (d) of this
section.
(b) Permissive changes may be made in certificated equipment, and
equipment that was authorized under the former type acceptance
procedure, pursuant to Sec. 2.1043.
....
==========
Sec. 2.1043 Changes in certificated equipment.

(a) Changes to the basic frequency determining and stabilizing
circuitry (including clock or data rates), frequency multiplication
stages, basic modulator circuit or maximum power or field strength
ratings shall not be performed without application for and
authorization
of a new grant of certification. Variations in electrical or
mechanical
construction, other than these indicated items, are permitted provided

the variations either do not affect the characteristics required to be

reported to the Commission or the variations are made in compliance with
the other provisions of this section.
(b) Two classes of permissive changes may be made in certificated equipment without requiring a new application for and grant of certification. Neither class of change shall result in a change in identification.
(1) A Class I permissive change includes those modifications in the
equipment which do not degrade the

[[Page 584]]

characteristics reported by the manufacturer and accepted by the Commission when certification is granted. No filing with the Commission
is required for a Class I permissive change.
(2) A Class II permissive change includes those modifications which
degrade the performance characteristics as reported to the Commission at
the time of the initial certification. Such degraded performance must still meet the minimum requirements of the applicable rules. When a Class II permissive change is made by the grantee, the grantee shall supply the Commission with complete information and the results of tests
of the characteristics affected by such change. The modified equipment

shall not be marketed under the existing grant of certification prior to
acknowledgement by the Commission that the change is acceptable.
(3) Except as specified below, permissive changes, as detailed above, shall be made only by the holder of the grant of certification.

Changes by any party other than the grantee require a new application for and grant of certification.
.....
(e) Equipment that has been certificated or formerly type accepted

for use in the Amateur Radio Service pursuant to the requirements of part 97 of this chapter may be modified without regard to the conditions
specified in paragraph (b) of this section, provided the following conditions are met:
(1) Any person performing such modifications on equipment used under
part 97 of this chapter must possess a valid amateur radio operator license of the class required for the use of the equipment being modified.
(2) Modifications made pursuant to this paragraph are limited to equipment used at licensed amateur radio stations.

(3) Modifications specified or performed by equipment
manufacturers
or suppliers must be in accordance with the requirements set forth in
paragraph (b) of this section.
(4) Modifications specified or performed by licensees in the
Amateur
Radio Service on equipment other than that at specific licensed
amateur
radio stations must be in accordance with the requirements set forth
in
paragraph (b) of this section.
(5) The station licensee shall be responsible for ensuring that
modified equipment used at his station will comply with the applicable

technical standards in part 97 of this chapter.
.....
(l) Notwithstanding the provisions of this section, broadcast
licensees or permittees are permitted to modify certificated or
formerly
type accepted equipment pursuant to Sec. 73.1690 of the FCC's rules.

[63 FR 36600, July 7, 1998]

>are not permitted to touch the insides. For proof of this, simply look at
>the FCC rules.

For starters, "modify" does not mean "touch". Also, 'type-acceptance'
was the old method of equipment authorization. Current radios require
'certification'. They are two different terms and are to be used
seperately, but for all practical purposes mean the same thing.

> According to section 95.607 (see below),

First, lets look at the entire 95.6xx subpart. According to 95.601,
this subpart involves technical requirements and applications for
certification. But for what equipment? That is found in 95.603:

==========
(c) Each CB transmitter (a transmitter that operates or is
intended
to operate at a station authorized in the CB) must be certificated. No

CB transmitter certificated pursuant to an application filed prior to
September 10, 1976, shall be manufactured or marketed.
==========

If a transmitter is operating on frequencies other than those in the
CB (which, BTW, can be found in section 95.625, as well as the
frequency tolerance), then 95.607 just doesn't apply.

But let's assume it does anyway. The first paragraph has two parts:

> Only the holder of the grant of authorization of the particular
>certificated CB transmitter may make the modifications permitted under the
>provisions for certification (see part 2 of this chapter).

As I showed in another post, Part 2 allows an Amateur Radio Licensee
to make modifications to type-accepted or certificated equipment if it
is going to be used in the ham bands. This is a specific, written
grant of authorization to the ham to make mods to any type-accepted or
certificated transmitter, not excluding a CB transmitter. (Part 2 also
defines issues such as 'verification' and 'declaration of conformity',
which are terms every ham should be familiar with.)

> No grantee shall
>make any of the following modifications to the transmitter without prior

>written permission from the FCC (Federal Communications Commission):
> (a) The addition of any accessory or device not specified in the
>application for certification and authorized by the FCC in granting the
>certification;

Changing bands is not adding an accessory or device.

> (b) The addition of any switch, control or external connection;

Changing bands does not reqire the addition of a switch, control, or
external connection.

> (c) Any modification to provide for additional transmitting frequencies,

"Additional" is defined in any dictionary as meaning "in addition to",
and (c) must therefore read, "Any modification to provide for
frequencies in addition to the CB frequencies". If a CB transmitter is
modified to operate wholly outside the CB, the stated modification
cannot apply.

You should now see that both 2.1043 and 95.607 seperately allow a ham
to legally modify a CB for use in amateur radio.

> I should also point out, since this is so often misunderstood, there is
>absolutely nothing in either of these rules that provides an exception for
>ham operators.

Not directly. Since these two rules reference Part 2, and 2.1043
specifically provides for such an exception, they do so indirectly.

Hello Eric:

Maybe the ham tests should now include a personality review and test.

Just like the morse code if not passed they could work on it at home some more.
The ham could brush up on being friendly and courteous. Being a human being, and better communication and conversation skills could be improved upon.

An apparatus could be connected to the new student of ham radio. When a goof ball, or unfriendly answer is given, a severe electrical shock in morse code could be given to correct the flawed thought process. I am sure after only a few sessions the student would be cured. Moving on.....

Advanced sessions could include having a few drinks, in moderation of course, talking to the opposite sex, explanations of moving out from the folks, whistling at pretty girls instead of yelling them to get out of the cross walk, and more. There's no end to the things that could be taught if a personality test was administered. I for one would sacrifice the morse code testing for more friendly hams.

On a little more serious note here.

Bob was over the line on anyone becoming the shooting victim.

But his statements about amateur radio being socially immature and needs some improvement is correct. The thing that throws me is why are there so many great and gold guys out there on ham radio, and the hobby is a major turn off to most people. This is a real shame.

I think what ham radio needs is to have the local clubs throw a social night, a few times a year. Where everyone is invited, and ham radio is shown how great it really is, and special public relations type things are shown. And NOT who's going to eat the most donuts at the emergency communications meetings, brawl.

Perhaps a few honey type cocktail waitress's and drinks at half price, wouldn't hurt none either.

Jay in the Mojave

I'l give a listen up there, William. Don't be embarrassed by the VHF dude. He is usually pretty sensible, I think he just felt real passionate on an issue that he thought was correct. A bigger embarrASSment can be found in our resident nocode troll who wants to be me so bad, he actually believes he is, at times. See what happens when a sociopath gets a cb and is rejected (My God, imagine how one would feel after being rejected by the CB crowd), gets an amateur radio (this way people HAVE to acknowledge him) and has no interest in gainful employment? It's ok, Dougie, you can come back to the freeband like you TRIED last night....but it's going to be hard to talk with only one lip, since your fat lower one is in my front pocket. That left a mark, didn't it?

Here is another tip, Douglass, use no contractions in your grammar. With each lesson I beat into you, your articulation has been lost only by your own magnificent limits. Even if you get that down, you are severely lacking. You could take English for the next sixty-two years and could not pass as even a half-assed clone of me. You have been a possession of mine since you arrived. I take you out and play with you when I am bored. When I shelve you for awhile, you clamor, whimper, shake, cry, and beg, like my youngest blue-tick bitch, until I take you out again. I violate only one of the golden rules taught me as a child, and that is not to take advantage of people like you. I admit it. I only play with you when I am bored. You are, for all practical purposes, what the county you reside in refers to as, "a bumper". I own you, Dougie, and there is not much you can do about it, sort of like when you try to talk on cb :)

I *think* the replacement is the MRF492. And yes, it will mount the same, but the pinout is different. One is BEC, and the other is BCE. I do not remember which is which. You can do a search for HR2510, which uses the same transistor, and should be able to find useful info. Sorry I don't have the particulars, but hope this helps steer you the right way.

Actually, they are quite different here. Technicians have full privilegdes above 50 Mhz, including running the legal limit of power. Although, I'm not so sure that is such a good idea. I wonder if some of the Techs that post here have been sitting a little too close to their high power VHF/UHF/MW transmitters. :-)

You are missing the point. *Adding* frequencies leaves the radio CB
capable and does indeed fall under Part 95. Moving it entirely to 10
meters is not a problem. Those with a better memory than mine might
remember the Browning LTD and several related SSB units which were
one-crystal conversions to 10 meters before the days of PLLs; conversion
instructions appeared in several Amateur pubs in the 70s when we supported
four major pubs and a host of minor ones.

AM was outlawed in 1972 on Marine freqs. So a lot of them ended up on 160 AM, complete with some of the more monumental helical dummy loads (marine antennas) you have ever seen. They were type-accepted (subsequently withdrawn). The repeaters you so love have their origin in the splitting of commercial channels in the late 50s in response to the same shortage of commercial channels that began CB. Conversion of gear is an ancient and honorable Amateur tradition; one local here who invented 'top-40' programming on broadcast converted the old 500 watt transmitter to 75 AM perfectly legally.

The distinction here is whether it is still capable of transmitting in a service requiring type-acceptance when one is done. Opening up a PLL is illegal for a ham or anyone else. Given that the rig requires more than opening up the loop to perform decently it probably isn't too bright either.

But a type-accepted or certified rig is not a shrine, it need not be worshipped or given any more respect than any other piece of hardware.

I think your point could have been stated with a bit more clarity and succintitude.

Canadian rules, JR. I haven't kept track of them but I think they use a form of the old Class A, Class B system we used prior to the early 50s -- and a decent system it was. While we never had equipment limits, we did require a year as a Class B to even take the Class A written exam. The difference in privileges was phone on the 20 and 75 meter bands. In those days, 15 did not exist and 40 was CW only so a Class B could only run phone on 160 and 10 meters. We had a similar one-year rule on the Extra until the mid 70s.

The Class A was renamed Advanced and the Class B General. As you point out a lot of water has flowed under the bridge since then.

Dwight, once again, YOU are missing the point. Call the FCC on Monday, explain the question, and get the answer. Under 95, right, a CB can't be used after modification. A CB is by definition not modifiable, so if it has been modified to operate elsewhere in the spectrum, again by definition, it isn't a CB. The law does not preclude a technician from opening the box and initiating repairs on a broken CB so long as he repairs it to within original specs. Your argument is specious. You've been licensed for about 2 years now with a vanity callsign. You apparently don't know the rules. You are able to quote Part 95 just fine, but take a look at Part 97.

Dwight are you kidding me? What we have here is another no-coder trying to interpret the rules set by the FCC Why don't you and VHF Buff go hang out on the local repeater, since you both do not have a clue....
You cannot modify the radio if you want it to remain a Type-Accepted radio, grantee, non-grantee or what have you. They are telling you in plain black and white No you cannot add freq, or modify the radio unless you are the grantee if you want it to remain a type accepted radio.Other than that all bets are off and you can do what you please with the radio, If you modify it and are not the grantee you cannot use it on CB Band because you need a type accepted radio. Get it thru your thick No-Coded Skull.

Hey we haven't had any real fun in a few weeks, so buy something from www.exportradios.com, and then let us all know how it went. A couple months ago a guy bought a defective radio from them and tried to send it back for a refund. The nice boys responded very publicly to the humble request for a refund. Go back and read the thread. Very entertaining. Would never actually recommend to anyone to send those guys at the truck stop any real money, but would like to know who else they have shafted in the last few months.

Dwight you ignorant ass , that's the point you don't understand the rules. Exactly once it is type accepted you cannot touch it for it to remain type accepted, ...Hams don't need equipment to be type accepted. I think they go over this on the Novice Exam... Oh whats that you didnt pass the novice exam .. so sorry
"Dwight Stewart" <stewartx@sccoast.net> wrote in message news:B6E1A21C.7694%> No, as I understand the rules, a ham is not permitted to modify a

I've been here... Usually scan, sometimes read, seldom post. I'm a firm believer that it's much better to remain silent and be thought an idiot than to speak and remove all doubt (Samuel Clemens is buried in my home town - guess it was bound to rub off). Anyway, every now and again I witness such supreme acts of stupidity on these echos that I feel that my own idiocy would pale by comparison and therefore feel free to speak out...

Regards and best 73....

That's the problem... People trying to read meanings INTO the rules instead of taking them at face value. When the rules specify modifications cannot be made to a TRANSMITTER, then that's exactly what the rules are referring to. That leaves the RECEIVER open to modification. The general history of US legislation is to allow freedoms and acts that are not specifically regulated. If a law states that it is illegal to shoot a neighbor's cow with a weapon utilizing centerfire cartridges, then it's perfectly legal under that law to blast away at the same cow with a .22 rimfire. Granted, there may be another law or regulation that makes the act noted above illegal, but under the Bovine CenterFire Law, rimfire potshots are not a crime. Ludicrous example, I know, but the fact remains that when the FCC is talking about a transmitter, it does NOT apply to the receiving section of a transceiver...

In the US, ANYONE can modify a radio transmitter. The ACT of
modifying the transmitter is not regulated, the USE of transmitters so
modified IS regulated. In the US, licensed amateurs of ANY class may
use transmitters modified to operate on the amateur radio bands.
Novice license holders (of which there are a few) are limited to 200
watts output on those frequencies where they have operating
privileges. Other license classes may use up to 1500 watts output
power on all bands with the exception of 30 meters and those portions
of the bands known as the Novice Subband (where Novices are permitted
to operate). Of course, if you utilize 1500 watts on 1.2 GHz, you
might as well set a bag of popcorn next to the antenna... That way
you can work stations AND make a snack at the same time... ;)

Er, Ray, since you claim to hang around here but sandbag more often than not, let me clue you in on something....headers..they are there for a reason. See, I do not write such asinine drivel. That was written by our resident hermaphrodite, nocode N8WWM Dougie Adair, who has fallen in love with and is in complete awe of me, and as a result, attempts to be me. It is not his/her fault, entirely. He/she can not handle the reality of what he/she is, usually due to her/his molestation as a child (hence, the preoccupation with same sex pornography and references). I believe Douglas is a well known in the county he/she resides, known as a "bumper", off the books by county officials. A "bumper" is one who has been under suspicion for sex crimes involving minors, but has never actually been caught and convicted. By default through overwhelming feelings of inadequecies, he/she retreats to a depth of the mind not known by sanity dwellers, one of sheer adulation and idolatry of one who has demonstrated repeated superiority over the capacitive challenged ego of said subject. This leads to an induced psychosis not unlike hallucinations and delusions of grandeur, where afflicted subject mimics and attempts to take on actual characteristics of the one he/she has elevated to deity-like status, which, unfortunately for the rest of the group, happens to be me at this time. There is no cure. Best hope is that he eventually will be caught and prosecuted. Since you made the mistake that is more common to newbies than of one who claims to be a regular here, no hard feelings. And to prove it, I'll let you play with Dougie for a moment before I relegate him back to the discarded prophylactic heap we keep him under when we are serious about things around here. Have a great weekend, Ray.

I need a amp that does about 500 to 600 watts,(Mobile Amp). I have about $180 to spend

1918. FS:RCI 2950 radio for sale,estate sale,$150.00 or best offer

Newsgroup: rec.radio.cb
Date: 2001-03-24 18:18:17 UTC
From: Robert Lonn <rlonn@home.com>
Message-ID: <3ABCE4D2.590C9601@home.com>
Source record: 76241

For sale is this RCI-2950 from a recent ham radio estate sale. Please check out the pictures. Radio receives great and power output in SSB shown on power meter. Nice overall condition, No mobile bracket or operating instructions. Played around with it, looks OK. Display looks funny due to flash from camera, it is FINE!! All reasonable offers will be considered. Buyer pay's shipping of
$14.00 UPS in the USA. Microphone is an ASTATIC mike with tone control on side. I am guessing but I think that this is not the original microphone but works great. Radio was tested and listened to on another radio, SSB is loud and clear, AM fine etc...
This is my reference link so you know who you are purchasing it from!
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=rlonn@home.com
PayPal or BidPay will work for me. USPS Money order or cashiers check is fine.

Find the guy in your home town who sells CBs for a living. Talk to him. Let him sell you a radio that you will be proud of owning, and that he will be proud of selling. When it breaks, he will fix it for you. When you need a new antenna, he will recommend and sell what you need, and when something doesn't work right, he will be there to help you. You might save five bucks by buying something from the guy on the coast or at the truck stop in Marshall, Texas, but they won't be there to help you and lend a hand when you need it, and if something arrives broken, you won't have to worry as much about getting it replaced. Just my opinion.

Power costs money, $180 will buy 200watts.
Clean power costs a little more, if youre serious about this contact me and
i will put you in
touch with someone on this N/G who can build a fine unit.
11meter linears require money up front, you make the choice......
Why do you need that much power?
What is the intended purpose of the unit?

>

I'd like to point out something here... the FCC doesn't make LAW. it has rules
and regulations that can carry the force of LAW when properly applies
through the Judicial process. However, you are right on the opinion about these
folks
being "First Class IDIOTS". Most people who use these "alternate market" radios
often interfere with other licensed services that may exist between the 27.5 and
28.0 Mhz
regime (that is a government service band in there folks). Also, some are bold
enough
to even try and use voice (phone) on the lower 200 Khz of the 10 meter amateur
band.
If they get caught, they deserve whatever the FCC requests the courts throw at
them!

>
> (PS: The fact that there are actual licensed hams engaging in illegal activity
> is no excuse for ANYONE to follow suit)

VERY TRUE!!!! This is another sore point among those who want to keep their
"services" clean... like the CB community, the ham community has its fair share
of bozo's and bootleggers. :(

The worst possible example a ham can display is showing others that he can transmit

on the 11 meter class D band using a part 97 radio! Often times, these "hams" are
more harmful to the amateur radio service than the rogue cb'er would ever be.

also, for edification: when you take the test for amateur service and receive that
paper (license), you automatically agree to all the rules and regulations as set
forth in the appropriate chapters of the rules (this may include periodic
or unannounced inspection of the station and request to retake the test
should there be sufficient doubt as to the validity of the license). The FCC
also reserves the right to revoke licenses based on anything from improper
operation of a licensed station to "bad character"

So, a lot of these "hams" that use their equipment in a band they aren't licensed
for,
or on a band where such equipment is prohibited by the rules and regulations,
they can be taken to court for many thousands of dollars and even face
the possibility of jail time (under the most extreme of cases) when they are caught

(Note, I didn't say "IF").

There were (and still may be) hundreds, maybe even thousands of cb radios that were modified by hams for use on 10 meters. I have often heard hams using such radios say in plain words they were using a cb radio modified for 10 meters. So if it is such a big deal with the FCC regulations, as you would insinuate, then a lot of hams would have paid a lot of fines or lost their license. I have never heard of any ham being fined, having their license revoked, or any other sanctions by the FCC for using a modified cb radio on 10 meters, have you?

I will mention that you are absolutely correct. The engineering staff is loaded beyond belief. It becomes a problem when you have input from 5 different managers as to what something is supposed to do. My big ambition now is to reach retirement! Some time back, the company sold an unprofitable business. It was purchased by an outside firm. Managers fled to other jobs within the company I work for. The new owner is selling the product as originally designed by my current employer. They hired almost all of the assemblers and technicians. The replaced management and marketing. The business has become very profitable and is growing at 25% a year. Guess where many managers ended up? Big hint, remember what I said about over 400 offices?

I have a Royce model #1-612 with a 4 pin hook up. The wires that I have are: red, yellow,violet and the ground wire which is copper.
Could you tell me which wires are for transmit,receive and audio out or how can I check to determine which wires are for the above?
Thanks,
Will

Date: 2001-03-24 23:04:13 UTC
From: twistedhed@webtv.net
Message-ID: <11797-3ABD27ED-194@storefull-124.iap.bryant.webtv.net>
Source record: 76412

"Ahahahaha! See the power of my control? I have the hermaphrodite self-admitting laughing at himself, only he/she has not the capability to comprehend what I have done."

This is by far the most outrageous thing you have done to date

"Aheeeehaaahahahahahahahah! See, Ray? Watch what happens when his master kicks the hermaphrodite's cage. He/she will cry for WEEKS. Check the last time I graced he/she with my words before this weekend. It was the first week of the month. He/she can't stand when his/her master ignores him/her. He/she cried, no, WHINED daily for three weeks until the master bestowed some attention upon the lowly non-learning animal beast. Comma should be inserted after the word, "date", county known offender. You could not practice correct English if you were promised a woman OR a brain, due to the lack of grey matter that results in your hanuman langur-like existence, let alone convince anyone of intellect that I could have written anything you profess."

my felonious friend

"Delusions again prevail. I would never refer to what I believe your county calls a "possible sexual predator" as friend. Move on. It will never happen."

and if I were to take your warped sense of reality into account I might be truly frightened.

"Adverb used as an adjective.... just how old ARE you? The gender confusion prevents you from acquiring basic grammar school foundations and how they apply to sentence structure, which explains how one could live to be as old as your picture portrays, and acquire such little knowledge throughout a lifetime. Each time you attempt to come off as semi-literate, you succeed in butchering what must, at least to your inferior ego, appear to be passable as legible. The inability and failure to self-recognize your cognitive dissonance is blatantly evident to others. Grab a dictionary."

Sending me a malodorous

"Wrong, junior. Another comma should be after the descriptive term."

filthy stained and sperm-juiced man's JOCK STRAP

"If no other, that sentence alone serves as the author's signature."

is low, Dougie, very low, but then thats

"Uh, uh,uh! Apostrophe between the "T" and "s" at the end of your last word. I understand it is difficult to follow all these lessons, the incontinence must take time getting used to. Therapy may assist in dealing with your shortcomings in this application. So can Attends."

what youre

"Another missed apostrophe. In college, we taught a Philippine chimp the entire Hebrew alphabet faster than the time it already has taken you to arrive at this point in my post. Phonics has done wonders for your kind. The chimp may be available for private tutoring."

all

The use of the word "all" is unnecessary and is considered "fluff", for al practical purposes. You rode a short bus to school, did you not?

about these days and it doesnt take a degree in

"..anything to see your rapid deterioration I have been responsible for. I agree. Besides, the only degree you are familiar with is what is on your rectal thermometer."

psychology to see it. Well
the joke is on you

"No, herm. Just because you can not comprehend or grasp what has happened to you does not mean it has not occurred. It is called denial and is quite common among the hermaphrodite afflicted. I assure you, this joke has never been as funny as it is now. To see you ball up your pudgy, fecal-stained fists, throw a pink tantrum, scream obscenities, wish you were me to the point of it consuming your world, and not even know what is happening to yourself, is the pinnacle of my unconscious achievements."

my tourettes-afflicted

"A proper noun, such as the name of a disease, is always capitalized, even though you are the recipient of said disease, it does not permit you to not capitalize it. Since you plagiarized the word, you should have plagiarized the capital letter at the beginning. Again, incontinence must have struck during that incoherent attempt at intellect."

tormentor because I am sending the aformentioned

"Your master does not misspell.
It is a-f-o-r-e-m-e-n-t-i-o-n-e-d."

garment to the chief postal inspector in the state capital of Ohio

"You are not in Ohio, OR Michigan. You are in California. Did we ascertain the personality of the liar with that last bout of incontinence?"

along with a demand that he trace the origin of the mailing to YOU Dougie, thats

"Demanding is YOUR forte, which is why you are so well liked and popular."

right it is going to come right back into your lap and then who will have the last laugh?

"The folks who have always had the last laugh..at your expense."

Me that's who. I am SICK

"Second admittance. Did the offenders group at the VFW that you are mandated to attend help you with this issue? They are to be applauded."

and TIRED

"Yep. We put on the liars persona here. Everyone in your area knows you do not tire. You are riddled on speed, attempting to lose that malignant mass on your frame that is in the process of killing you. It is certainly only a matter of time until the diet pills you are addicted to do you in."

of babysitting you here and waiting to see what else you will send me so you have dug your own rotten hole Dougie and we shall see what transpires.

"The talking to oneself is akin to an "ego pep rally" to reinforce the psyche. It is a natural defense mechanism employed by the brain to counteract the serious deficits it is unconsciously made aware of. Your hoops are getting farther apart, Dougie. Pretty soon, you will have none to jump through. I reiterate, you are incapable of even the most simplest of comprehensions. I will attempt to make you understand. You see, I give them to you, and I taketh away, at my slightest whim and will. You only get attention here when I say you get attention. That makes you my property. The best part is, you are incapable of hearing the thunderous roar of laughter, caused by my incessant belittling of you. That is worth even YOUR weight in gold!" :)

CBS is showing "Survivor 2" this winter. In response, Texas is
planning "Survivor, Texas Style." N8WWM will vie for cash and prizes
against his/her part-time lover, fellow hermaphrodite, and traveling bow
tie salesman.
The two freaks of nature will start in Dallas, travel through Waco,
Austin, San Antonio, down to Houston and Brownsville. They will
proceed up to Del Rio, on to El Paso, then to Midland/Odessa, up
to Lubbock and Amarillo. From there, they proceed to Abilene, and
on to Ft. Worth and back to Dallas.
Each will be driving a pink Volvo, with a bumper sticker that
reads "I'm out of the closet, I voted for Al Gore, and I'm here to
confiscate
your guns." A "licker" break has been mandated to one bar in each town,
where the duo will attempt to reenact the famed, "Blue burro" Tijauna
shows of olde.
The first one to make it back to Dallas wins.

I would like to get any feedback on building up my 29 LTD Gold. I've been told its a good starting place for a really strong radio. I would like to know what to ask to be either done to or replaced to kick this radio up to the max. Also would like to hear opinions or experience with good mobile antennae's for this radio on a semi. If this is not the route to take, what has anyone to say on the Galaxy series? I want to put a really strong, reliable unit in the truck that will get out a long way, with roger beep and talk back (the 29 already has these).I have heard that there are add on's like bigger finals and so on to do this, but if the cost really goes up I would think that maybe going to a different radio would be the thing to do (galaxy 66 or 88). I look forward to everyone's help and info. Thanks.....Swede

Easy - you read it and say what IT says. I have made a valid point, and even
though I've said this a few times, some people obviously don't read the whole
thread before replying, so this is for the cheap seats:

If you read Part 95 without knowing about the exception granted to hams in Part
2 (as was the case this time), it appears that there is no exception to the
rule in Part 95 that says a CB can't be modified. By contacting the ARRL, they
were able to clairify the matter (Again, as I've already posted).

Your "29" probably has the 2sc2028 final in it, that radio can be tuned to swing 17watts w/a
5watt dead-key (plenty loud), a bigger final (2sc1969) and driver (2sc1957) will make the
CB shop money but they wont do a helluva-lot for the radio.
A Turner microphone will make a bigger difference than the big final, spend your money
where it counts: Times LMR400 coax, Amphenol connectors, Turner RK-56 mic., Star-gun
makes a MEAN antenna but you get what you pay for.
A 4ft. Firestik may serve you well, dont get an antenna that is taller than the trailer.
Big power does not make you get out further, it only makes you louder at that given distance.
The antenna is the heart of any great system and will provide the largest gains in performance.
Go to "Firebreathers Page", he has a great feature article on mobile antenna fundamentals.

A CB wave is about 36 feet long. To efficiently transmit this wave, you need a minimum of a quarter wave. This can be accomplished with an antenna that is long physically or electrically. The antenna is electrically lengthened with coils. Loading coils reduce the current flowing through the antenna. Since power is the product of voltage and current, loaded antennas start with a disadvantage. You should use the longest antenna you dare use on your vehicle. I would never use a 'Lil Wil, it's too short. I would not use a FS II because the longest they come is 5 feet.

I use a KW-7 exclusively. I was given a KW-4 and it has no ears and poor transmit in comparison. I was also given a Wilson 1000 mag mount and I find that to be a minimum for decent radio communication. It works pretty good for a base loaded unit, but I prefer the full size, properly grounded antenna mounts. BTW, I've been CBing since 1977. Good luck.

> Here you go. Some paragraphs deleted for bandwidth.

Section 2.932 offers nothing in itself. Instead, it refers to section 2.1043 for conditions where modifications can be made to certified equipment. The only part of 2.1043 that applies to hams doesn't give authority to modify equipment certified in other radio services. If you look at paragraph (e), the only part that mentions ham radio, it says...

(e) Equipment that has been certificated or formerly type accepted for use in the Amateur Radio Service pursuant to the requirements of part 97 of this chapter may be modified without regard to the conditions specified in paragraph (b) of this section, provided the following conditions are met:

It then goes on to list the conditions. However, the key to this paragraph is in the first line - "equipment that has been certified or formerly type accepted for use in the Amateur Radio Service" may be modified. It says absolutely nothing about modifying equipment that has been certified for use outside the Amateur Radio Service.

First of all, you (the consumer) cannot certify or uncertify a radio. It is certified by the manufacturer, who is the one who decides the intend to the device. When you buy a CB radio, it has already been certified (so 95.6xx does apply) and you have no legal authority to remove that certification. And section 95.607 specifically states that "only the holder of a grant of authority of the particular certificated CB transmitter may make the modifications permitted under the provisions for certification." A ham operator does not hold a "grant of authority" for that particular CB, therefore cannot modify the equipment.

> As I showed in another post, Part 2 allows
> an Amateur Radio Licensee to make modifications
> to type-accepted or certificated equipment

And, as I have said in reply to that other post, the section of Part 2 you quoted does not give authority for hams to modify equipment that has been

certified for use outside the ham bands.

>> (c) Any modification to provide for additional
>> transmitting frequencies,

> modify a CB for use in amateur radio.

No, I don't see how 2.1043 and 95.607 allow a ham to legally modify a CB for use in amateur radio. Therefore, until that is established, the FCC rules concerning CB still apply, including the rules that prohibits modifications.

> And so you have.

Sparky, you cannot cut and paste sentences out of the rules, ignoring the clear stipulations on those sentences, in an effort to make your case. The parts of section 2.1043 you're basing your claim on, and quoting, has a stipulation ("equipment that has been certified or formerly type accepted for use in the Amateur Radio Service"). Therefore, the sentences following that stipulation does not apply to equipment for use outside the Amateur Radio Service (such as a CB). In the end, section 2.1043 does not give ham operators authority to modify a CB radio.

No, I undertand the point very clearly. It is true that CB radios have been modified for use in the ham bands for many years, without any negative repercussions from the FCC. However, the point I was trying to make is that there is nothing in the rules that would legally allow us (hams) to make those modifications. In fact, the rules seem to specifically state that we (or any other consumer) cannot do so. And that seems so whether we just add frequencies or move the radio entirely to 10 meters.

Well, since you're so much better at interpreting the rules than a simple no-coder like myself, please show me where in those regulations it supports your claim that my position is wrong. I have quoted sections of Part 2, Part 95, and Part 97, of the United States Code of Federal Regulations - all of which support my position. You have shown nothing that supports your opinion. Therefore, I will comply with those regulations, not your opinion.

The radio is type-accepted, or certified, by the manufacturer as it leaves the factory. A consumer has not legal authority to certify, or uncertify, a device. And the rules specifically state that only the manufacturer, the holder of a grant of authority, has the legal right to modify a certified device.

Antenna length and Wavelength are 2 different monsters, the Wavelength on
Citizens Band
varies from 34'@27.405MHz - 34.7'@26.965MHz
Otherwise i agree with you 100%, the "Lil Wil" is a base-loaded 1/4wave
compared to the
"Firestik II" as a top-loaded 5/8wave.
When current is applied to a coil it generates heat, anything left over
after the luvbugs are cooked
is used to create RF energy, loaded antennas rob signal-strength on transmit
and receive.
Any loaded antenna whether it be top, bottom or center-loaded cannot compare
to the 1/4wave
102" whip.
102" whips are not for the inexperienced tuner, they require about 3" added
to their length to
work successfully on 11meter.
If i had to choose a loaded antenna it would be a top-loader because the
antenna see's the
entire signal before it is attenuated by the loading coil, base-loaded
1/4wave's are by far
the worst choice.
If you must have a loaded antenna always choose a antenna with the longest
whip, the coil does nothing but create heat so keep it small if you must
have a loaded antenna.
A lot of drivers think if it costs more it must be better, WRONG.
Wilson's are the biggest joke i have seen on a display
rack.....
P.S., dont click the links.

JR, as I've already stated, there are many hams who are, and have, used modified CB radios in the 10 ham band, but that is not the topic. The topic is whether they have the legal authority to do so under the regulations. And the fact that many have done it, with few problems, does not answer that question. Many CB'ers use linears without problems from the FCC, but that does not suggest for a moment they have the legal authority to do so.

By the way, I have not insinuated that "it is such a big deal with the FCC regulations." Several have made statements in this discussion and I have simply replied to those statements. It is no more of a "big deal" than that.

The latest craze on Large-Cars is tilting the antenna forward so it clears
the bridge, or maybe
someone told them skip runs better when you bounce the signal off the road
(moon-bounce).
You might be a Trucker if the DOT requires a Oversize/Overdimensional Permit
for your
mobile antenna farm...
Hello, is this thing getting out or shorting out,BREAK.....

I have been asked to do this a few times. I believe it is based on an
idea that tipping the antenna will "pull" the front lobe down closer
to the horizon, and thereby increasing gain in that direction. Too bad
it doesn't work.

Oh, I don't know, the "chicken hauler" look may have some factual basis in angle of radiation, but for a radio that is used primarily to talk 60 feet beyond the next set of taillights probably not much more value other than making the profile of the truck a little lower to avoid branches and bridges, see it a lot on dumps/tankers/flats where the tractor and trailer height is minimal and yet they still want to use a 48" or taller antenna instead of 36".

No repercussions because nothing illegal is being done. When it is all
over, it is no longer blessed but it does not need to be.

You are trying to turn a piece of hardware into a shrine. Getting down on
one's knees and fiddling with your rosaries is not required by any part of
the rules.

You have alot to learn Maddog, for starters you are telling a trucker to buy Times LMR 400 coax for what a 12' run what difference will this coax make except make his pocket lighter, and yes more power will get you out further, if more power did'nt get you out further everyone could run 1/2 watt or 1/4 watt instead of 4 watts. If i have 100% modulation at 4 watts, and I have 100% mod at 100 watts which would you hear louder? 20 miles away. The only smart thing you said was about antennas... Go Hit the Books ..

"Mad Dog" <lgssl@netzero.net> wrote in message

I'm ignoring them because the arugment is over. I told you, but I guess you're either missing some of my posts or you are ignoring them. I emailed the ARRL and they confirmed that Part 2 allows for hams to modify a CB. You guys are the ones continuing the discussion.

That's too bad. Afterwards we were gonna drive down to the local Pathmark with our vans and 1988 Suburbans with the dual "coily-type" antennas on top, key up our 2kw amplifiers and I could yell "1, 1, 1, 1, 1, 1" and you could yell "2, 2, 2, 2, 2" and we could see who can be heard over who.

It would be a blast. A good ole' Jersey Keydown!

Exactly they are the only one who can modify it for its continued use on CB
Band.
Why cant I un-certify my radio ? I can do anything to it I like I own it.
But if it is un-certified by me or anyone else but the manufacturer I cannot
use it on the CB band.
Again Call ARRL you are a member arent you?

<stewartx@sccoast.net> wrote:

> First of all, you (the consumer) cannot certify or uncertify a radio.

Anyone can apply for certification of a radio frequency device. Your
statement only shows your ignorance of Part 2. And I have yet to see
anything in the whole of Title 47 about "uncertification". You and
your alias VHF should get together and start an FCC study group.

> It
>is certified by the manufacturer, who is the one who decides the intend to
>the device. When you buy a CB radio, it has already been certified (so
>95.6xx does apply) and you have no legal authority to remove that
>certification.

How did you come to this train of thought? Where at all does it say
that doing anything to a radio "removes that certification"? Of course
you can't remove a certification because it is not something that can
be removed. But when a RFD no longer meets the technical standards
that are required under the certification, it is no longer legal under
that certification. That doesn't mean it can't be legal for other uses
or under another certification, and the complete lack of case law in
that regard strongly supports this argument.

> And section 95.607 specifically states that "only the holder
>of a grant of authority of the particular certificated CB transmitter may
>make the modifications permitted under the provisions for certification."

Key phrase: "modifications permitted under the provisions for
certification". If the transmitter were to continue to be used under
such provisions, then modification by anyone (except the grantee)
would be illegal. The provisions of a RFD to be operated on CB are
that it must meet technical standards for CB transmitters. When those
standards are no longer met, certification under those standards no
longer applies to the transmitter.

> A
>ham operator does not hold a "grant of authority" for that particular CB,
>therefore cannot modify the equipment.

A ham license does not grant any authority to make any modifications
permitted under the provisions for certification. Modifications that
are not made under the certification void the certification for that
device simply because it no longer meets the technical and/or
intentional standards as stated in the application for certification.

>>> (c) Any modification to provide for additional
>>> transmitting frequencies,
>
>> "Additional" is defined in any dictionary as
>> meaning "in addition to" [SNIP] If a CB
>> transmitter is modified to operate wholly
>> outside the CB, the stated modification

>
>
> No, I don't see how 2.1043 and 95.607 allow a ham to legally modify a CB
>for use in amateur radio. Therefore, until that is established, the FCC
>rules concerning CB still apply, including the rules that prohibits
>modifications.

Disregarding 2.1043, I assume that you agree with my points on both
(a) and (b) of 95.607. However you made no comment on (c).

Now to address the whole definition of 'modification'. Suppose I take
a scrap CB and pull a resistor. Which part is certificated -- the
radio or the resistor? What parts must I pull for the radio to no
longer be considered a radio frequency device? All? Half? Just one?

A radio frequency device is something that emits RF radiation. If it
does not emit RF, it is not a radio frequency device. But is a broken
transmitter a radio frequency device? Yes, because it's design is
intended to emit RF. So a non-functioning CB radio is still a CB radio
if it's intended use is for the CB. Both operation and intent are
important, and are addressed in Part 2 as the essential elements of a
RFD.

Now if a ham operator modifies a CB radio with the intent to use it on
the ham bands, is it still a CB radio? No, because it no longer is
intended for use on the CB, and it no longer operates on the CB.

Your argument has been about there not being any rule that authorizes
the ham to change a CB radio into something else. Well, what if a ham
purchases a non-working CB radio with the intent of using it on the
ham bands? It doesn't operate on the CB, and it is no longer intended
to operate on the CB. It is no longer a CB radio, even if it hasn't
yet been modified. If it is no longer a CB radio (transmitter), then
it is no longer covered under Part 95.

Last, but certainly not least, whenever the rules are not clear, the
ham must use "good engineering" practices. If the ham is not clear
about the rules and can make a decent 10m rig out of a CB, he has the
authority to do so.

I can see where that is confusing - I read it, "Equipment ... for use
in the ARS ...". I'll concede on this because of weak grammatical
construction.

Then you need to pull the mod limiter and get a very loud echo mike and set
it on it's highest setting.
If you are running at a house and have lots of neighbors then I suggest the
Star Duster antenna as your neighbors really do need to enjoy your side of
all CB communications.

ok nocode tech lets try again. Hams can legally modify a CB to work on ham frequencies. Of course they can't use it on CB frequencies after modifying it cause it's no longer type accepted.

WHERE's THE TROLL-O-METER!!!!

"VHFRadioBuff" <vhfradiobuff@aol.comspamsux> wrote in message news:20010322143601.00889.00000276@ng-ck1.aol.com...
>For hams, it is still permissable to 'modify' a CB rig for 10 meter
>operation, posess it and use it (on ham bands). Part 95 pertains only to CB
>operation, not Ham.

Part 95 applies to ANYONE using a CB, INCLUDING hams. Therefore, a ham must comply with the Part 95, Subsection D rules, which strictly forbid ANYONE from
modifying a CB. Even hams.

If there is an FCC rule someplace that says that a ham may modify a CB, please
direct me to it. If it exists, then the FCC is contradicting itself.

Hello.

I am a fairly total newbie to CB and Amateur radio. I am interested in
both, but CB seems to be the simpler one to start with. (plus you dont need
a license)

Plus you won't get chewed out by arrogant technohambogeeks that will
put you down for being a rookie!

Are there any real good newbie-guides out there, or any good (free) reading
materials on the web?

Also, what kinda range can I expect from various styles of units, and how
much power should be behind one for it to work effectively?

They all put out the same. When tuned up, they vary. SSB units will
have more power for more range.

What brand names would you suggest? I'm on a bit of a budget.

Uniden only. Period. Most the rest is junk made in RED China.

My ultimate goal would be a mobile unit (car mounted is fine) that can get
me about a 20 mile transmit range. Is that possible with CB?

With a sideband unit it is. Are you on flatland or in the hills,
and which state?

Thanks in advance!

YOU tell them Andy Handy!
Dave!!!!!!!!!!!!!!!!!!!

"Handy Andy" <CodysPC@Iserve.Net> wrote in message
news:oe3mbts2fqnt011sdrr3g3he8fp3k4nktl@4ax.com...
Greetings!

Viewing the description of the radio at www.cobraelectronics.com, I
believe you'd like the RF Gain control flexibility the Uniden 520 will
provide you.

At least you'd be able to reduce the noise and adjust receiver
sensitivity to make the trips more enjoyable.

It's a little more for the Uniden, but you also get a proven chassis
design that has lasted throughout the years. Decades, really.

The Cobra 19 has come in a variety of flavors and different
manufacturing site origins. Cobra 19, in the +, Ultra, DX, DX II,
Ultra II - mostly cosmetic changes and as of 1994, a major
restructuring of the chassis to a cheaper method that uses modular
designs.

Before 1994, they were made in the Philippines but after 1994, they
were made...who knows where??? Mostly China and Malaysia.

Take the Uniden over the Cobra...IMO.
This will pose problems for many environments that are harsh on both
the driver and anything in the vehicle, bumps and potholes come to
mind.

On Thu, 22 Mar 2001 16:40:16 -0500, while the modem was ice fishing
with the Mouse, "Steven Kohn" <svkohn@bbtel.com> dissertated the
following:

:+> If anybody could help me with this dilemma, I would appreciate it. My
:+> question is which cb is better for all around use? The Cobra Ultra II,
or
:+> the Uniden Pro520?
:+> Any info on this matter would be greatly appreciated.
:+>

Regards! |

The Astatic Mobile Max is not a Speech Processor,it is a voice recorder
w/echo.
And from what i have heard it aint worth a s--t.
The SPA-1 and the SP1-A are Dynamic Speech Processers made by distributed by
John Mahoney at Panther Electronics.
The difference between the 2 is that 1 is sold in kit form and the other is
preassembled.
They both require adjustment after installation,for more info on this goto
"Firebreathers Page"
and scroll all the way down to the bottom.

I hope you are getting a 2950 (old style), i dont care for the new DX'r.
Like any good 10-12meter rig they need to be aligned yearly if used mobile.
If you enjoy SSB you should get something else, but the AM is unbeatable.
2950's are famous for a very powerful receiver, then again front-end
overload
can be a asset when used correctly.

Greetings!

Although this may be an "opinionated" post, I can say that using an AM-only radio won't hurt you, but you could be missing out on another world of communications that you could benefit from in just staying with AM-only.

My guess is that you need to consider what SSB modes do and how they offer the "better range" - it's not only the modes, but the required support circuits needed to make SSB work.

Lot's of people use SSB radios for not only SSB modes, USB and LSB, but for their quality as well. You always get AM with a typical CB radio, and to remain "compatible", the CB radio realm also has both AM and SSB modes in radios. So you don't lose anything by switching over to a CB with SSB in it.

You get better filtering, and if you're into radios, a sense of more control using the radio.

By the above, I mean that you have more features to use, and the radio comes with extra filtering and support circuits to give you more control of the features than that which you'd find in an ordinary AM-only radio.

The support circuitry makes the radio perform better in both AM and SSB modes. You get a heavier duty radio in both transmit and receive.

Now, what you should buy is another subject. This is the "opinionated" part. It's up to you, there are a lot of AM-only radios, and not as many AM/SSB types around anymore.

In essence, try looking for a radio with good stability and noise and adjacent channel rejection figures, the higher the dB factor the better it is. It comes at a price though, so what should you spend? You can get SSB radios for CB for less than $100.00, or you can spend close to $500.00 and up on other models.

Determine your needs, if bleedover isn't a big problem in your area, you can spend less and get a lot for the money spent. But, if you live in a big city, with a lot of powerful stations around you [hint:bleedover] you may want to spend more money on a better rig.

As far as models?

Well, Uniden has the PC-122XL and Grant XLT, along with Cobra 148 styles and then there's RCI, Galaxy, Melaka, Midland, and Cherokee.

<asbestos=on>

Then there is always the Ham/Amateur radio line that also gives you
the above and more modes. Since you posted a general question to the
rec.radio.cb - I'm assuming CB.

<asbestos=off>

Greetings!

Interesting added page to the http://www.sec.noaa.gov/SWN/index.html
site, the D-layer absorption index.

This page is a good indication of absorption levels in the D-layer.

With summer on it's way, the D-layer will naturally intensify and
hence early morning skip levels will drop, with less skip heard during
the daylight hours, with increasing levels of noise and skip returning
during the early evening hours lasting well into the night.

Since the "sun never sets" above the arctic circle during the
summertime - a lot of noise will be with us throughout the summer
months late into the night.

Bummer...

Richard I would like to comment on your observations of the "OLD Tech Plus" hams. I am and have been one of those people since 1974. Only due to the code requirement I couldn't achieve my "General", that didn't stop me from being a good or progressive ham. Some people can get the code while others can not, that doesn't make us any less a good ham. I take exception to your comment about people in my class. I/We had to pass the General Class written exam or we were back to either nothing or a novice. "I", like some of my fellow OLD Timers had to pass our written exam in front of an FCC Examiner, there was no talking or fouling around in those days. Only due to the recent change in FCC laws have I and others achieved our goal of becoming a "General". In fact I love 10 meters, especially from my vehicle. Over these past numerous years I have taught ham radio theory classes so that others could achieve the license of there choice.

Being in amateur radio since 1974 I know numerous extra class operators, I only know one that has the same or similar feelings as you about the Tech Plus Class. In fact he thinks he is much better that anyone else that doesn't have an "Extra" class and that he walks on water. It's hard to have any respect for people in that category. Get the message. I was 34 when I passed my "Tech/General" written exam while completing my college education, working two jobs and tending to my family. I feel darn good about that. After I retired from law enforcement I opened my own commercial two-way shop, I and my technicians worked on ham radios at a nominal cost to save our fellow hams a few dollars while doing our duty to the company.

In conclusion. Code doesn't make the ham, there are a wide variety of opportunities in the amateur radio world and code isn't a major part in the majority of them. Have a positive day.

Pappy

2053. Re: Firestick II or Lil Wil?

Newsgroup: rec.radio.cb
Date: 2001-03-25 21:50:42 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <c9psbtkpvna45kbag0hq92mh7aajtgpv51@4ax.com>
Source record: 76576

Greetings!

Well, length is the most important part of the "deciding which antenna to use" problem.

To keep it simple, "use the longest length acceptable to you - and provide for it".

Lil' Wil is a base loaded, and is less that 4 feet long, in height.

Firestik, comes with various lengths, ranging from 2 feet [not recommended] on up to 7 feet.

Considering the wide variety of lengths [in Firestik], and the overall weight and wind drag, the mounting locations and required mounts to hold these beasts are the hardest part of the selection - once you've figured out what antenna and length to use.

Lil Wil has a base-loaded mag mount - pre-packaged and ready to go. The simplest by far, but is only for limited use. Can't take a lot of power, and with it's small coil design, works very well for local communication, but what are your needs?

Thats the key word, needs!

Shooting skip? The Lil Wil isn't designed to work with power. But nothing is impossible. You might be in for a disappointment though when it comes to long distance contacts.

Firestik? Can do the job, but you need no less than 5 feet long antennas to do any damage. Or at least have any distant contacts.

Francis is also not out of the question they are lighter in weight and less overall wind drag, like the Lil' Wil - but you need a mount to hold it in place and a length of 5 feet [like the Hot Rod model] or the Amazer [heavier antenna] which is the closest thing to the 102" whip in that line.

It's up to you, but determine your needs first, then choose and mount accordingly.

If you don't want to drill, it further limits your options to mag-mounts or stake mount antennas.

2054. Re: TRC-485 Channel Expansion?? This could be it!

Newsgroup: rec.radio.cb
Date: 2001-03-25 22:00:01 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <r7qsbtsd1kqf473rshnrm5jkccm94rec56@4ax.com>
Source record: 76577

Greetings!

The TRC-485 was the predecessor to the Copper Kopy Sidewinder, and now, a lot of other clones - including the Magnum 257/357. This whole mess started around 1993-1994 with Radio Shack introducing the TRC-485 to replace their older TRC-453 series AM/SSB radios.

The *original* to me, IMHO, was the Pro-640e from Uniden with the type of illumination that seems to have been copied over to the 485 series, and the fallout from it. Nighttime illumination is nice, I'm not knocking that, just the "explosion" of clones all copying the 485 layout.

I just wish Uniden would wake up and start selling that 640e radio again...sigh...

Like your opinion means anything but,again let me ask you a question without you side stepping it. If I give you a call sign does it mean it is me? What advantage is it for me to give you my call sign. What would it benefit? Whats yours? Oh you don't have one.

Do you have a bug up your ass about Radio Shack?

You never seem to consider anything technical at all, other
than second hand, about anything until after you make your
'statement' regarding it's lineage and how you like or dislike
any company it's associated with. Regardless of who
actually makes the radio. Or specs that version of it...

Greetings!

See replies below yours...

On Fri, 23 Mar 2001 22:28:07 -0600, while the modem was ice fishing
with the Mouse, "Zenethian Sebistar"
<magiremovethis@gallatinriver.net> dissertated the following:

:+> Hello.
:+>
:+> I am a fairly total newbie to CB and Amateur radio. I am interested in
:+> both, but CB seems to be the simpler one to start with. (plus you dont
:+> need a license)

A good way to start, it introduces you to radio. But, due to the lack
of license, you also will experience a lack of responsibility from
some operators on the CB band, don't get discouraged. It's part of
life.

Welcome to rec.radio.cb...

:+> Are there any real good newbie-guides out there, or any good (free)
:+> reading materials on the web?

http://www.iserv.net/~codyspc/cbindex.htm

It's a basic intro to the controls and some things that you'll need to
know about CB installations.

:+>
:+> Also, what kinda range can I expect from various styles of units, and how
:+> much power should be behind one for it to work effectively?

This is an open question. If you're looking into running power, aka
linear, the requirements are beyond the scope of this message. Using a
linear takes on a whole new ball game.

Get a radio that meets your needs, if you can afford it.
Then using a linear will be a second choice *after* you've
decided to use the right radio for you.

If you get the radio that meets your needs, then using a
linear may not ever be needed.

A typical CB radio will give you 4-watts AM carrier power, but using
an AM/SSB model will improve those figures considerably. Spending more
for the radio and antenna will give you a better expected level of
performance.

:+> What brand names would you suggest? I'm on a bit of a budget.

Uniden - for budget and bang for the buck. But, if you're into exotic radios - RCI and Galaxy are big prizes for those so inclined. But they also cost $$$.

You can have a big-$$$ radio, and sound like a mud-duck if you use a poor performing antenna or wrong/poor mounting locations.

Mud-Duck: n, pl. - 1. Used to define a weak station or a poor performing radio system, distorted audio, squeals, and/or poor reception of other stations. 2. An indication of the status of the operator and/or their stations performance. See: Ho-Po Miracle.

:+>
:+> My ultimate goal would be a mobile unit (car mounted is fine) that can
:+> get me about a 20 mile transmit range. Is that possible with CB?

Properly mounted and installed with a good antenna, expect good performance and reliability from the unit. Can't speak of what you probably will hear, but overall - if you do more for your station [mobile or base] the better it will work for you and your needs.

Use and install a good antenna and mount that is acceptable to you in the longest height and placed in a good spot on the vehicle. Once that is accomplished, you're all set - have fun!

:+> Thanks in advance!

You're Welcome!

Regards!

Greetings!

Yes, because the trailer itself will add an SWR problem if the tips of
the antenna lean back too far while whipping in the wind. Too close to
the trailer and it can affect even the pattern they wanted to obtain
using the co-phasing harness.

2062. FYI: I just installed Heliax....Impressions..

Newsgroup: rec.radio.cb
Date: 2001-03-25 22:54:44 UTC
From: mc_turner <c_turner@ix.netcom.com>
Message-ID: <UGuv6.65967$Xt3.9303450@news1.rdc1.az.home.com>
Source record: 76585

I thought I would drop a line about the Heliax that I just put up on my base station. If you are thinking about putting some up this will help. I have thought about getting heliax for years now. Since my Belden 8257 was getting tired after 4 years of Arizona heat I decided to take the plunge. I am going to a new antenna as soon as its ready so I wanted to get the Hardline installed and tested first.

I used Andrew (www.andrew.com) LDF1-50 Heliax. The LDF1-50 is the 1/4 inch version. This is the best 1/4 inch that Andrew makes. Its noted at .667 db loss for 100ft @ 30mhz. I used the formula and 86% velocity to figure I needed to go in 15.5 inch increments. My loss is in the .350 db range for my run at 27.225mhz. The cable takes 3.3 kw continuously at 30mhz at 212 degrees. I dont run that much power so thats not a factor for me. The specs are close to the large LMR400 cable and this is only 1/4 inch! The 3/8ths version is incredible but its just not needed for me. I purchased the Cable from Talley Comunications. It is not cheap at $1.24 a foot. I later found that you can get it for $1 a foot if you look around..

I put the Heliax up for several reasons. 1. I like to get the most possible out of what I have. I talk on 4-5 watt Tube radios 90% of the time. I need all the help I can get. 2. With 115 degree heat Coax does not last long in arizona. Andrew rates this cable at 10-15 years service life. I will not have to replace this for many years. 3. I wanted to minimize Intermod and shield bleed through.

If someone tells you this stuff is heavy they are wrong. This cable is light. Its MUCH lighter than the 8u I took down. It bends easy and retains shape its shape. It is copper pipe after all.. Its not much stiffer than LMR 240. The only problem that you will have to watch for is kinks. This stuff crushes easy. If you step on it your done.. It will crush flat as a pancake. If you pull on it when its coiled up you run the risk of putting a kink in the outer copper. Be carefull when routing this cable. One of us stepped on a section and had to cut it off and redo the connector. Lucky for me this was at the end and I had extra.

Putting the connectors on is a BEAR. Its bigger than mini 8 and smaller than 8U. There is NO reducer for this cable. If you want a perfect fit get the Fire retardent version. It fits the Mini 8 reducer and is simple to install. It has more loss but is still leaps and BOUNDs better than 8U. I had to fill the gap with Solder. I took my time and made a good tight connection that I feel good about. Be warned as its not fun.

I used Heat shrink over the entire connector once attached to the antenna for a water tight seal. I also zip tied the cable in a maner so the cable does not hang on the connector. We used UV rated Zip ties all the way down the cable on the inside of my 45 ft Rohn tower. The tower has a 10 ft

section ontop as well. We used Ties on that section to be safe. DO NOT pull the Zip ties down hard. You will Crush the Cable. Be gentle with it.

SWR is 1.4 on 26.865 and 1.4 on 27.505. 1.0 on 20. We used an MFJ anylizer to test before we transmitted. I use a Sigma 4 antenna. As I said before I am waiting for a new design and should have it soon. One this to note: My power readings are exactly the same on bird 43 between my antenna and my dummy load. 15 watts the the dummy is 15 watts on the antenna... I had a small change in readings before the heliax. Power readings in the pep mode are exactly the same.. 48pep on the dummy is 48pep on my antenna system.. I can switch back and forth over and over.. Not sure why this is now the same but it is.

How does it work?

Bleedover is GONE. Nothing. Nada.. Zip.. Ziltch. I have a TV in my radio room with Rabbit ears.. I used to blank the picture out on ch3 and 5 with a barefoot tube radio. There is NOTHING at all on the picture now. I loaded up 500 watts.. NOTHING at all on the TV. I used to bleed over my Phones with certain old radios. NOTHING. I used to slam over the PC speakers in the next room.. NOTHING.. I have not talked to the people next door to find out if it helped them(bleedover there phones) but I cant tell you that the 100% shield is reducing the RF inside my own home. This is with NO TVI filter in line. I took it out as it made no difference for me. I tested with and without the filter..

I cant comment on the performance as far as transmit and recieve yet. There is to much skip comming in to talk to locals. I did talk all over the world today on my President George but I did that before the Heliax. My old cable had 1.6 db loss on my run new. It was old and stiff when I took it down. Still.. Even if it had 2db loss as compared to my .3db loss now that is not much of a difference but should make some difference far out. I talk to people on ground wave that are 20-30 miles away. If there is a difference they will notice as they all took readings before I made the switch.

If you need new Coax you should think about this stuff. It is expensive but worth it if you can afford it. If you put up the large stuff it will have almost NO loss of any kind. I cant tell you that it will solve your bleedover problems but it did help me in a very big way. It was worth the $100 for me not to have to climb that down tower and change out the coax for many years!

Hope this helps.

MC

2063. Heil HC5 and HC4 mic elements in D104??

Newsgroup: rec.radio.cb
Date: 2001-03-25 22:57:34 UTC

Message-ID: <yJuv6.65984$Xt3.9304189@news1.rdc1.az.home.com>
Source record: 76586

Has any of you tried the Heil mic elements in a D104? I got a chance to hear the HC5 on the air the other night and it was incredible. This was a yaesu 850 with the HC5 in an MC50 mic. It was the best sounding radio I have ever heard. The elements are $29. Several of my old D104's have Worn elements that do not work.

Did you like the change?
Will the HC5 match up to the old tube radios?

Thanks!

MC

My dream setup? I have it already, I have a stock Uniden President
Washingtom base station with the plain 40 AM, USB, and LSB. I have an
Antron99 mounted on a tripod on the roof of my 2 story home. What more
do I need?

Anyone can talk around the world on 11 meters running all kinds of
power. You want a real thrill? Make contact legal and barefoot. THAT is
working a radio and working contacts. I'll never forget the first time I
had a real conversation on a radio as a chld, I had a SBE 40 channel
mobile with uper and lower sideband hooked to a power supply sitting on
my desk in my bedroom, with a simple 4 ft fiberglass whip also mounted
to my desk in my bedroom. I bought both radio and antenna at a garage
sale for $8.00 the power supply I purchased for $15 from the electronics
store in town with money I got from mowing lawns. The first night I
hooked it up and (I was supposed to be in bed sleeping as i had school
the next day) started scanning the channels listening for people to talk
to. I turned to channel 13 and heard some people talking from the othe
side of the next town. Thier distance was roughly 20 miles line of site
from me. I asked for a break, they gave me the go ahead. I met Ratchet
my first radio friend that night, and in 3 months I got to meet him in
person when he opened a garage in my home town. When we met face to face
he brought up my setup, he said "I still don;t believe you are talking

off a 4 ft ant. mounted on your desk in your bedroom", so I had him come over and look for himself. He was amazed, and a week later it happened to be my birthday, he stopped by and gave me a birthday present, he gave me my first real base antenna and helped me get it set up. I still have the old radio and the antenna he gave me for my birthday. They are set up ay MY garage where i work on my vehicles, and my other hobbies (music, radios ect.). I don;t need power to talk to my friends, even with the solor activity I an still talk to the people I want to. And sometimes I even get a suprise, like the one day i was driving back home from defiance and was talking to a friend on 13, someone breaks in and asks who I am, he heard me from atlanta and I am in the n.w corner of ohio in my car, with a barfoot radio. Now granted that isn;lt going to happen to often that someone that far away will hear me when I am running legal power. but it is all that more exciting when it does happen.

Thats my 2 cents worth

The couple of extra watts won't make a whole lot of difference not matter what anyone tells you. You can greatly improve performance by using the best antenna you can affford.

YOU tell them Handy! Also the Pro-540 too. I have a NOS Pro-340 brand new in the box for $100 & ship if anyone wants it. I told all potential customers that the digital will konk out, which will be covered by the company. That's why I still have it. Sold my last USED 540 @ $150 ! Dave!

"Handy Andy" <CodysPC@Iserve.Net> wrote in message news:r7qsbtsd1kqf473rshnrm5jkccm94rec56@4ax.com...
Greetings!

The TRC-485 was the predecessor to the Copper Kopy Sidewinder, and now, a lot of other clones - including the Magnum 257/357. This whole mess started around 1993-1994 with Radio Shack introducing the TRC-485 to replace their older TRC-453 series AM/SSB radios.

The *original* to me, IMHO, was the Pro-640e from Uniden with the type of illumination that seems to have been copied over to the 485 series, and the fallout from it. Nighttime illumination is nice, I'm not knocking that, just the "explosion" of clones all copying the 485 layout.

I just wish Uniden would wake up and start selling that 640e radio again...sigh...

Yep, it seems that certain CORPORATE CB Shops, as 1 driver told me "None of them are any good," in order to keep putting "Mod Kits" in, because of good preachers like myself that have preached against modulation kits for years, have NOW resorted to calling them MEGA Tune ups, which is one of 3 of alleged choices of CB tune ups they have! It is a weird type of Mod. kit that drops the dead key to 1/2 watt, and modulates to 4 (on Bird RMS, not peak or peak to peak meter)! Customer is told to keep it on using PA/CB toggle. Driver that had this done could be barely heard a 1/4 mile away, with an antenna problem. I showed him what the butchers did for $80 and improved him incredibly for $20, fixing problem. Moral of the story--IF your local independant CB shop has more than 1-3 stores, it probably isn't Local or independent! I see MANY unhappy drivers these days because of CB Butcher Thieves!!! Has anyone else seen such nonsence?
Dave!!!!!!!!!!1

I have been asked to do this a few times. I believe it is based on an idea that tipping the antenna will "pull" the front lobe down closer to the horizon, and thereby increasing gain in that direction. Too bad it doesn't work.

Uninformed quote:"...."I'm not knocking that, just the "explosion" of clones all copying the 485 layout..."

No one is "copying" the 485 since they are ALL made by the same company, called "Dragon". The dragon 485 CB was an existing radio "private labled" by radio shack, as was the Dragon 485+ 10M radio (as the HTX-10). Uniden is NOT affiliated with Dragon. Others such as Magum & Titan & Roadforce are also buying the Dragon radios & having them "private label" a faceplate. If you do a web search with a GOOD search engine, using keywords like Dragon CB & 10M radio... You will come up with the orient websites showing the full line of Dragon Base, Mobile & HT radios. The "Cherokee" CBS-1000 base was the Dragon 497 Base too....

At least once a week someone wants something I have never heard of, like a ten-pound-driver or a "mod-box" (apparently an audio preamp you plug inbetween your mic and radio). Last week it was an "artificial ground" that the person claimed you connect to your battery and it would eliminate SWR. Where do they come up with this stuff? Well, it just takes a yuppie with a marketing degree to turn this CB quackery into a quick buck. I even thought about doing it myself for a while, since the CB stuff is just a small part of the business. People are just too gullible.

Ditto. If you talk skip, either it's there or it isn't, and the power
won't make a difference. If you talk local, an improvement in the
antenna will provide much more gain than increasing the power a few
watts.

You need to double the power to make a significant improvement,depending on the radio you
can quadruple available output by making internal adjustments.
Most famous name-brand radios are capable of being turned up to 16watts or more on a
modulation swing,dead-key is usually around 5watts w/a modified radio.
The Cobra 29GTL or LTD is a fine platform to start with,avoid the S/T version (their junk).
Almost every mass-produced radio is in a state of de-tune,taking it to the local CB shop to have
it peaked & tweaked will ensure it is a top performer.
Using high quality coax with Amphenol connectors will ensure maximum signal transfer between
the radio and antenna.
The antenna is the HEART of any great system,the "Lil Wil" was not the best choice because
it uses a capacitive/inductive coupling to ground the antenna.
Also it is a Base-loaded 1/4wave w/a short whip/large coil design (what were they thinking).
Anyway,you can draw your own conclusions with a formal education.....
check out tech help here http://firestik.com .
mobile antenna fundamentals here
http://members.stratos.net/cwe146/index.htm/FB_home.html .
and a wonderful article from our very own Bill Eitner
http://www.conk.com/world/kd6tas .
Feel free to e-mail if you have more questions.....

>
> Pappy
> Retired for the Second time

At one time I held the old 5wpm Tech in the days of the one-year Novice. When seniority was everything, you did things like that to preserve your call. Went thru the '58 spot cycle on six-meters; Cycle 19 made everything since look like a wet firecracker. Been there, done that, and dusted the trophy with the sweatshirt.

Code is a problem only if the person lacking it makes makes it one; you obviously have not. Since it is all history now in your case, the hows and whys are just as irrelevant as the hows and whys of my passing 20 before the FCC in St. Louis about the time you were getting started. Actually, it will not disturb my digestion a whole lot when CW disappears as a testing criterion. Most dittyboppers feel the same way if for no better reason than when it is learned it will be done right, aiming for the Journeyman level of about 16 instead of learning a lot of bad habits passing a 5wpm exam. Taking the emotional heat out of the process cannot be anything but positive.

Which brings us back to the No-Code Tech. By way of background, the Tech began in the 50s with a 5 wpm requirement which remained in place until 1991. For most of those years, the written exam was identical to the General so that when the requirement for all licenses was lowered to 5wpm last April, Techs of Pappy's vintage were grandfathered to General with a bit of VE paperwork. So aside from the name, the Tech ticket was revamped in 1991 to two forms, the Codeless Tech, and the Tech Plus with the 5wpm added using essentially the Novice written exam. Both actually survive but the Plus is no longer kept by the FCC data base. So don't get hung up on the noun Technician; I don't. There are several flavors of the class floating around.

So the context of the discussion was what I as an OT (although you are 3-4 years older than me on the calendar) would advise a beginner to aim for. I advise a rapid attack on Element 1, preferably before attacking what is a pretty trivial Element 2. The history of sub-General licenses has not been good with respect to upgrading and the no-code has a particularly miserable record. In fairness to the no-code group this may be partially explained by the fact that to an extent that can only be speculated upon there were a number of licenses issued to wives to bring home bread and milk, sons for camping/hunting trips, and groups of friends who went coyote hunting twice a year. This mixed intent, to my mind at least, does not make it suitable as an entry-level license to HF Amateur Radio. It is hard to get code in the schedule when you are camped on the local repeater

or, for that matter, working Africa on six meters. My objection is to the license, not the licensee. The Tech has been a blind alley for fifty years for those whose ultimate intent is HF Amateur Radio; only you know the truth of your case and I don't want to know. So I cannot in good concience recommend the Codeless Tech to a newbie when code will be with us for at least five years.

Unless one is detached from the real world, he cannot help but note the heat and friction between the coded and uncoded Amateurs. There are indeed those who think they derive some status from what is essentially an obsolete mode everywhere but the ham bands. To be sure, there are wallpaper collectors: the Aircraft Telegraphy Endorsement on the Second Telegraph was still quite popular (note: same code as the First Telegraph but no sea time) long after aircraft quit using CW and Second Tels were unemployable. Put up a mountain and someone will climb it. No argument; us old farts give them a major reaming at every opportunity. But not where the Codeless Techs are likely to overhear. When I got in, call signs were in sequential order and you changed it by moving out of the call area, the FCC going to some length to give you a new one of equal prestige. Surely you have heard of the notorious W2OY, the Old Yankee from New Yawk: CQ 20, No Kids, No Lids, No Space Cadets (sidebanders), no K's, no WA's. You knew where you stood in a hell of a hurry. Like any fraternity, there are those who feel called upon to inflict some of the same hazing rituals we faced. The seniority system was given a well-deserved enema in the 70s and the vanity system pretty well finished the job. Here again, although not in earshot, those pushing these inanities get their hemerhoids wirebrushed.

But the vitriol is more than matched and in fact provoked by Codeless Techs. The record on this newsgripe speaks for itself. I call it Lifer Tech Syndrome. Characteristics seem to include:

1. Destroying CW as a mode.

2. Attacking, unhorsing, and mugging everyone who ever passed a code test at any speed.

3. Becoming resident geniuses at all sorts of arcanities, most of which they get wrong.

4. Endless discussion of wondrous new modes without producing anything.

5. Subscribing to everything, joining everything, and proceeding to indulge in every radio-related activity known to man except downloading Morse Academy from http://ah0a.org.

6. Playing status games with CBers and anyone else they can buttonhole.

So go ye in peace. When 10 gets down, try 17 meters. At the moment all I can do is listen but this will change.

But I still would not recommend a pure codeless Tech to anyone so long as the near-term HF requirements include a code test.

Greetings!

Hmmm...Dragon? This looks interesting...any URL's?

Web Presence? I try searching using your keywords.

This could explain a lot of what's been happening in the CB world as
of late...

And yes, I do apologize if Dragon was the first to MFG this style. I
simply did not know about them.

I can thank the press for this oops, in the USA we're a sheltered lot,
we only see what "they" want us to see.

But, for the radios introduction to the USA, it was due to Radio
Shack, no one else. I am not aware of any Dragon Distributors here in
the USA.

And I've never said Uniden was affiliated with Dragon. Don't know
where you got that, but Uniden was/is responsible for the 640e.

shrug

Here are some "artificial grounds" from MFJ.
http://www.mfjenterprises.com/tuners/mfj934.html
http://www.mfjenterprises.com/tuners/mfj931.html

The 934 includes an antenna tuner, so it could allow your rig to see a nice low SWR in a mobile. I own a 931 that I bought hoping it would be a magic box that would cure all of my RFI ills. It didn't fix my problem, but does allow me to tune a length of wire along the floor as a ground counterpoise.

Not a dumb question. Means dead key AM watts with NO modulation (true watts, not distorted with peak or peak to peak meters), which highly inflate true AM power (RMS) readings!
Dave!!!!!!!

2108. Re: Heil HC5 and HC4 mic elements in D104??

Newsgroup: rec.radio.cb
Date: 2001-03-26 03:22:56 UTC
From: Gary Danaher <gdanaher@home.com>
Message-ID: <3ABEB5DD.2E646F72@home.com>
Source record: 76527

I use an HC4 in my Kenwood mic. Heil elements are about the size and shape of a ttl clock crystal-totally unlike anything that came out of the Kenwood. I used some foam rubber to cushion and position and after a few years of use it still works just great. I've never had a D104 apart at the mic end, but it couldn't be any harder than disassembling a MC60. Bob Heil makes great mic components. If you doubt it, just ask him!!

In rec-radio-cb the illegals are getting gray hair, because they cannot freely advertise their illegal amps and other CB stuff in teh net. Their reaction will be interesting in the future.

Has the world turned against you, or might there be a remote chance that what you use for CB is considered illegal, even among people who are not "whining hammies"?

Illegal CB sucks,

Gary

Well, Ryan, no matter what the guys in the stores tell you, a vertical doesn't have too much of a gain over a dipole. If you like to work with your hands, a simple 5/8 vertical would be a good choice for you if you can put it on your roof, clear of metal objects.In addition to aluminium tubing you need some PVC tubing, maybe an inch in diameter, and a few feet of the kind of copper lead you might be able to find inside an alternator (with clear lacquer on it). I built a 5/8 with a coil of around ten twists around the PVC tubing, with four quarter wave ground planes, even though a 5/8 would work a lot better with 5/8 radials. The radials are critical to the working of the antenna: if you have an insufficient amount of copper wire under the vertical, you get a lousy signal. My antenna worked well enough for me, try building one and you might become the next guru in CB aerials, who knows:-)
The beautiful thing about the homebrewed 5/8 is that it costs you next to nuthin' and works maybe even better than the commercial ones.
If you, on the other hand want more elaborate types of antennas, maybe you could build one, but they are a bit harder to construct. See links on the ARRL homepage for further info.

Maybe it got it all wrong: I thought the guys talked about non-skip conditions. Of course we can work foreign countries and such with the help of reflections from the various layers of the ionosphere. The sky's the limit, even with a few watts and a vertical.

2131. Re: Heil HC5 and HC4 mic elements in D104??

Newsgroup: rec.radio.cb
Date: 2001-03-26 08:50:51 UTC
From: Major Tom <EmailBrokenBy@home.com>
Message-ID: <LpDv6.626331$U46.19111963@news1.sttls1.wa.home.com>
Source record: 76454

I have both the HC4 and HC5 in my D-104 head, side by side. I started with a block of that soft foam and cut out the shape to fit inside the mic head with and sharp hobby knife then cut out the foam to fit the 2 elements. It took me 2 tries til I got it right.
The 3 pins to the mic head will work for this combination(share 1 pin between the 2 elements). I also drilled a small hole on the top of the mic base and added a small toggle switch to switch between elements, HC5 for local work and the HC4 when working DX. I also trashed the amp board inside the mic base (I didn't need it).

Hope this helps, good luck
Major Tom

Deadkey refers to holding the PTT (push to talk) button down with no
modulation.
To put it simply, key the mic. but dont say anything.......Dead-Key

102" 1/4wave whip is the best for mobile use, you will need to add a spring
or quick-disconnect because they are about 3" too short electrically.
Always mount the antenna as high as possible for best results.

My dream setup? I have it already, I have a stock Uniden President Washingtom base station with the plain 40 AM, USB, and LSB. I have an Antron99 mounted on a tripod on the roof of my 2 story home. What more do I need?

Anyone can talk around the world on 11 meters running all kinds of power. You want a real thrill? Make contact legal and barefoot. THAT is working a radio and working contacts. I'll never forget the first time I had a real conversation on a radio as a chld, I had a SBE 40 channel mobile with uper and lower sideband hooked to a power supply sitting on my desk in my bedroom, with a simple 4 ft fiberglass whip also mounted to my desk in my bedroom. I bought both radio and antenna at a garage sale for $8.00 the power supply I purchased for $15 from the electronics store in town with money I got from mowing lawns. The first night I hooked it up and (I was supposed to be in bed sleeping as i had school the next day) started scanning the channels listening for people to talk to. I turned to channel 13 and heard some people talking from the othe side of the next town. Thier distance was roughly 20 miles line of site from me. I asked for a break, they gave me the go ahead. I met Ratchet my first radio friend that night, and in 3 months I got to meet him in person when he opened a garage in my home town. When we met face to face he brought up my setup, he said "I still don;t believe you are talking off a 4 ft ant. mounted on your desk in your bedroom", so I had him come over and look for himself. He was amazed, and a week later it happened to be my birthday, he stopped by and gave me a birthday present, he gave me my first real base antenna and helped me get it set up. I still have the old radio and the antenna he gave me for my birthday. They are set up ay MY garage where i work on my vehicles, and my other hobbies (music, radios ect.).

I don;t need power to talk to my friends, even with
the solor activity I an still talk to the people I want to. And sometimes I even get a suprise, like the one day i was driving back home from defiance and was talking to a friend on 13, someone breaks in and asks who I am, he heard me from atlanta and I am in the n.w corner of ohio in my car, with a barfoot radio. Now granted that isn;lt going to happen to often that someone that far away will hear me when I am

running legal power. but it is all that more exciting when it does happen.

Thats my 2 cents worth

You have 2 options. You can either find one of the remaining parts houses that still have stock of the device (It was discontinued by the manufacturer), and pay a premium price for it (And while you're at it, buy a spare, since they will eventually be gone), or,

You can try to adapt another type device in its place. I've been able to successfully adapt an MRF455a device in a Jackson, and it will work, but it's a chore to do. You have to drill the heatsink to mount the device since it is not at all like the original. Once the physical mounting is done, you can expect it to perform slightly less in power output than the original MRF477. I got about 35 watts out on SSB vs. about 45 with the '477. However the MRF455 is a much "tougher" device, and it runs cooler, and takes more abuse (The guy I did the work for used to constantly pop out the '477, and since the conversion, has not popped it once).

It comes with a sense of accomplishment, and is a alot more fun than
shelling out a few hundred bucks and plugging it in. I like to make
contacts with different radios. I got Mexico City a couple weeks ago
on my Lafayette tube rig with only 2 watts.

If it's too easy, it becomes boring too quickly.

If I remember right, the two Voyager probes used no more than a few
watts to talk to the Earth when it was jillions of miles out in space.
Now THAT'S DX!

This is a neat looking little radio, but it is basically a CB. At the price I've seen these going for ($300) you could spend a few dollars more and get an older model ICOM 706 or Yaseu FT100. A few of the extra features from a real amatuer rig like the ICOM or Yaseau are more power, a better reciever, full HF coverage, 6 meters, 2 meters, and 70cm(depending on the model), and CTCSS tones for repeaters. As I recall, the 4900 doesn't include any tones for 10 Meter repeaters.

That being said, there is a lot of Superstar 4900 info at www.cbtricks.com. It looks like the radio can be set to default to a CB, 10 meter, or wideband personality depending on how jumpers are set inside the radio. If you do buy one, please come back and give a review of this rig from an amatuer perspective.

In rec-radio-cb the illegals are getting gray hair, because they cannot
freely advertise their illegal amps and other CB stuff in teh net. Their
reaction will be interesting in the future.
Has the world turned against you, or might there be a remote chance that
what you use for CB is considered illegal, even among people who are not
"whining hammies"?
Illegal
CB sucks,
Gary

Au contraire, G ary! Your posts sound quite sour and trollish. Why the
animosity? Why are you stirring the pot? Nothing has slowed. It just
takes place underneath your noses and just a tad beyond the limited
vision scope of folks like yourself. The inability of you to locate an
item on the net does not mean it is not there.

2159. For Sale : Cobra 148 GTL and a Frequency Counter

Newsgroup: rec.radio.cb
Date: 2001-03-26 16:54:36 UTC

Both of these are on ebay. 7 hours left and counting!!

The radio has been a good unit and has never failed me. It has expanded channels and is ready to go. The radio is a 9 out of 10 on a scale of 1 - 10. Look for item # 1223461342 for more information.

The counter works also, used it for rabbit hunting, road maps and minor alignment work. I know it works for 10-11 meter but it will cover more. For more information on the Super Star 250 Frequency Counter look for item # 1223463128.

Like I said, both items work and are well worth it.

Brian

With your solution he still has the same problem he had before.....

The MRF455A (isolated stud mount device) IS ALSO A DISCONTINUED DEVICE!

> and it will work, but
> it's a chore to do. You have to drill the heatsink to mount the device
> since it is not at all like the original. Once the physical mounting is
> done, you can expect it to perform slightly less in power output than
> the original MRF477.

If you can fit an MRF455 (tab mount device) into the same space, then consider
using an SD1446 instead.

It has the same size and basic parametrics as the MRF455 but has a higher DB
gain.

> I got about 35 watts out on SSB vs. about 45 with
> the '477.

That extra couple of DB gain from an SD1446 may give you those 10 watts back
that you lost with the switch to the MRF455.

> However the MRF455 is a much "tougher" device, and it runs
> cooler, and takes more abuse (The guy I did the work for used to

> once).
>
> Dave
> "Sandbagger"

I'm sure the SD1446 is just as 'tough' as the MRF455 and might even be a little tougher!

Regards,

#12

evaluate the difference in tuning for different angle of radiation.
After talking to you,

hello 55 how do you accomplish this.
how do you tune for skip talking
and then for shoot outs???????
i'm running 2watts antenna space at 6ft.8inches thanks

> communications meetings, brawl.

I went to a local Ham Radio club meeting back around Xmas time. What tuned me off were two main things. First was the heavy emphasis on H.F. operations, which is not my area of interest. Second most of the members were well in to their 50's, any many were retired with nothing better to do than chase paper awards, drink coffee, and eat donuts. I saw very few people my age, early 40's, or hardly anyone younger. So in the end I did not join because I did not feel I had much in common with the general membership at this particular club. I may check out some other radio clubs in the future, and hopefully the membership is more diversified, both in age and interests.

Jay, there is a little more to it than just throwing a social party to attract potential members. For me I had to feel that I fit in with the group. That didn't happen at the club I checked out. The people were very friendly I have to admit, even asked me if I was interested in teaching a licensing class, but it just did not "feel" right. Somewhere I read that the average age for a typical US Ham is around 57 years old. How do you make a young person feel at home among a group of people who could be old enough to be their grandfather?

Just out of curiosity how do you, did you, identify him on the so-called freeband? Is he using his station call sign? If he is a Ham then why not report him to Mr. Riley Hollingsworth, the Man himself? As Hams we don't need bad apples like this spoiling things for the rest of the Ham community.

RHOLLING@fcc.gov

Yes that's the correct E-mail address for Mr. Riley Hollingsworth, direct. I have sent E-mail to him, and I can assure you he very much does reply to personal E-mail! It may take a week or two, but he does take the time. Surprised even me. I though I would just get a reply from a FCC no-name staff member. Nope. He gets personally involved alright. He prides himself on the job he is doing with Part 97 enforcement, and he gets my thanks too, along with many other Hams, for a job well done.

I guess that's one difference between Ham and CB. Hams take seriously keeping our house in order. Too bad the same can't be said about 11m in general. There's lot of room for improvement. Just have to have the courage to do something about it, 11m that is.

There are plenty of young people getting into ham radio. In Saturday VE sessions we give an average of 20 tests in a four hour period. Most of those people are in their teens and twenties. I don't know where you are getting your numbers from. Amateur Radio license counts have been going up year by year by an average of active licenses each year. Now I'm not saying that all of those licenses are active but what I am saying is that there are more new licenses than there are expired licenses each year.

I will ask you this Matt, where are you getting your numbers? There is no official "die off" registration requirement for the FCC. If you die your license just expires, there is no requirement for the estate to notify the FCC. How can you tell the difference between someone who has not renewed and a person who has died. Yes you can look at the SK list in QST but like I said our VE session alone licenses that many each week on average. What about the hundreds of other VE sessions? Anyone who says that ham radio is dying off doesn't know what they are talking about.

    FWIW, Eric, check the (cough) amateur you are replying to.

Snip

This guy ROUTINELY comes to the freeband to agitate, gets his lips cut off, which pisses him off to no end, so he comes out here and preaches law and solidarity among hams. He is the worst type ham. A hypocrite.

Just out of curiosity how do you, did you, identify him on the so-called freeband? Is he using his station call sign?

"This guy is so well liked, I was sent almost every piece of information one could ever possibly want on someone from well meaning people all over the country who are better equipped at playing PI than I. This includes the frequencies where he hangs out on both the freeband and two meters. He is indeed one and the same. Thing is, I don't care. I usually let his rabid ramblings go by, but every once in awhile he needs reminded that he is insignificant, unless I ascertain otherwise, which I won't, save for my own entertainment."

If he is a Ham then why not report him to Mr. Riley Hollingsworth, the Man himself?

"Not my style. Personally, I feel like he should have the right to say what he thinks of me over the air, whether I like it or not, as long as it is done without libel or malice. The public stating of one's mere opinion, considering the source, is at best, folly fodder. Also, he does not offend or bother me in the least."

As Hams we don't need bad apples like this spoiling things for the rest of the Ham community.

"Sucks, but you got 'em."

RHOLLING@fcc.gov

Well Dwight,
you are forgetting that ham radio equipment DOESN'T have to be certified.
Part 95.607 says

• 95.607 CB transmitter modification. Only the holder of the grant of authorization of the particular certificated CB transmitter may make the modifications permitted under the provisions for certification.

The only reason that you can't modify your CB is that if voids the certification to operate in the CB band. Notice it says "provisions for certification." Which means it will no longer be certified for use in the CB band. That's the ONLY reason. I've modified many CBs over the years to operate in the 10-meter band. Radio Shack used to sell a wonderful little 4-channel, 5-watt "mini-4" mobile that worked beautifully on 10-meter AM voice. All it took was new crystals and a few tweaks to coils and you were on the air on 10-meters. They were and still are PERFECTLY legal to use on HAM BANDS by a LICENSED HAM OPERATOR. I can take any piece of equipment from any radio service and modify it to transmit on a ham band and the ONLY requirements that I am to follow are the emission and power standards put forth in part 97. That's it, nothing more. By modifying the equipment I void the certificaiton for its designated service but not for ham radio. In other words I can take a broadcast band transmitter and modify it for 160 meters and it's perfectly legal for me to use on 160 meters as long as I don't violate power or emmission requirements for 160 meters. I've modified automatic door openers (10 ghz) for use on ham bands. Perfectly legal. But I can't "unmodify" them for use as door openers because by the first modification I voided the certification for the original use.

"Sucks, but you got 'em."

Since he's on the so-called freeband we don't have to put up with him. Guess that makes him your problem. 8-))

"Why even attempt an analogy? What's your point?"

The point that almost always seems to be missed is the Ham comminity is interested in cleaning up our bands. You will even read it in the various Ham news groups. Now on the other hand I don't see the same level of interest expressed along those lines here in the CB news group.

"Yea! And my reply to this oft-erroneous statement is the same as always. Like the Liberty Net?"

One day they too shall be gone, count on it.

"My, my, erroneous AND mistakenly self-righteous."

I don't think so.

"Yup. On hammie freqs and cb."

So you do a little flip-flop there, from your "self-righteous" comment to agreeing something needs to be done with the current state of 11m?

"About what? Has it ever occurred to you that maybe, just maybe, the hammies are considered more harmful than the cbers and that is one reason why amateur enforcement exists and the FCC threw in the towel with cb?"

The FCC went after Part 97 violations because Hams have been practically begging for enforcement efforts for a long while. And that is a fact. Now with a new head honcho running the FCC things may change for the better with 11m Part 95 violations. One of the E-mails I got from Mr. Hollingsworth leads me to believe that if he had a budget he would be doing to 11m what he has been doing on the Ham bands. The attitude the FCC takes with CB/11m can

change if enough people convince them it is a problem. More and more Hams are getting sick of the yahoos showing up on 10m, and elsewhere. This is not going unnoticed by the FCC. What ultimately gets done is anybody's guess right now, but something will be done, and maybe not entirely favorable to the 11m group.

Granted, there are people in this world who dont need a 25amp power supply.
So why waste bandwidth stating that you dont need a 25amp power supply.
On the other hand there are people in this world who have a need to operate
13.8VDC
mobile equipment in a 120VAC environment, this makes the the demand for a
25amp
power supply valid.

Maybe some of them have the capability of building or modifying their own equipment. Myself, I find a little handheld gives me WELL over 40 mile solid 24/7 coverage. Unfortunately, there is no more a sanity test for a ham license than there is for anyone to use a CB. Doug is not a particularly good example of a ham.

> Sparky, FLRC
Yes Sparky I do have lightning protection.

To illustrate my point that I made in my earlier post. Just today I was
able to make contact with someone in england on 40 USB today while

sitting at my desk in my shack. It wasn't intentional, I am part of a local sideband club that has a call in meeting the first sunday ever month, while having the meeting last night my radio took a crap on me, so I fired up one of my radios that I have collected over the years, many will probably laugh but it is an old Sears 40ch w/sideband base with a desktop mic. This radio had been sitting in the closet for about 8 years, so I pulled it out dusted it off, got out my can of electronic tuner cleaner and made sure all the contacts were clean. Once I got the cover back on I fired it up and made sure the antenna was tuned. I checked my meter and the power/mod levels to make sure they were in specs. then called for some of my friends locally to see how it sounded. Someone from england called back, I was pleasently suprised. Like I said... you don't need to run power to talk, it is alot more rewarding to make contacts with the minimal amount of power. I am going for my amater license, and look forward to experimenting with low power.

Ain't much of a mod; X band radars ran at more or less 10.525 GHz right above the ham band.

It was possible, even showed up in 73 magazine, to FM a 10.480 or so signal and make the machine read anything you wanted (23.5 Hz per MPH sticks in my mind). There was a ham who had to attend a meeting in St Louis periodically which meant he got to fight the traffic over the Missouri river at St Charles. He built up one of these in the double nickels days to ease the trip.

The experiment failed when he set off every radar detector for miles and actually slowed traffic. When he was ticketed for 55 in a 25 (he didn't reset his jammer) the gizmo went to the landfill.

If that's the one I'm thinking of, it will only do 40 channels due to the
ROM that RS specified. They also they a similar radio for 10 Meters. It is
also unmodifiable due to ROM coding.

Oh gee! Makes me want to go right out and buy a really old Suburban, strip the seats out of it, mount a V-8 in the back, stick 6 or 8 Leece Neville alternators on it to charge the huge batteries I will have to buy to run my 2 pill that drives my 4 pill, that drives my 8 pill, that drives my 32 pill, that drives my.....aw nevermind.....but those really silly looking, non-resonant mobile yagis look like they would make nice bird perches at the zoo.

The echo sound is NOT produced electronicly,the echo is a result
of NOTHING inside of the station operator's head.This can usually be
prevented by the operator wearing ear plugs.Alas,the operator usually
forgets

legally.

That's a mis-statement considering this is a CB newsgroup.

In other words, you can never study enough to ever *legally*
be able to use an amp on the CB (11 meter) band in the U.S.
if you hold a current CB license.

Hams that push licensing are ignorant of the fact that the FCC
rules (not laws) only apply to people who agreed to abide by
them (aka the licensed people). Only when the local ordinances
start taking shape will there be real laws by which unlicensed
CBers can be legally be prosecuted.

Think about it.

Everything he says is crap.
It's based on no real knowledge.
The DX series 2950s are the best 2950s
ever made. They are better than the old
ones in a number of ways--mostly relating
to reliability and attention to the little problems
that the earlier ones had.

Source record: 76742

What Dennis suggests is the best way to go.
I know because I've been there. Uniden uses
the 455 in the newer units, but as Dave Hall
wrote (and I experienced as well), the 455 is
a lower gain part that won't produce the same
peak output power numbers as the 477 and
497 would in that application. Using the 1446
device is a better way to go. And for those
who have the newer units with the 455s, using
a 1446 and directly grounding the emitters (the
stock circuit has emitter resistance for one
reason or another) will get you the same power
numbers as in the older units with better reliability.

Aside from the fact the antenna could care less, the old police radars were continuous signal, not pulse. In use, they simply counted the difference between the incoming and outgoing signal (Doppler) frequencies. Same thing on Kband at 24.525 GHz

I hate to say it, but what Randy says is really a pretty good
accessment of what DC CB competition really amounts to.
And AC isn't a helluvalot different.

Think about it. Do you really want to sink all your resources
into a comp setup in hopes that you'll beat out some other
misguided people (aka losers) in order to enjoy the 10 seconds
of glory that comes with being announced the winner of a
certain class and being able to grasp and wave a trophy over
your head for a few seconds? Is CB that important, or have
you simply lost sight of what is really important: family, a real
relationship, and a real future?

It is a "so called" 225 amp leece. If you would have said 240 amp large case it would have been believable. I believe you are the same guy trying to sell 1500 watt 5 pills. You claimed they would do these kind of numbers at stock voltage. I would be very leery about you. That alternator you mentioned barely has enough diodes to hold 200 amps.

You apparently do not know anything more than books can teach you about antennas. In fact the "Mobile Yagis", which by the way are not any books. Do in fact work very well and are very resonant and very directional. What I think you are doing is assuming that since a CBer built the antenna system it just cannot work. You need to do a little research with directional mobile antennas before you make any more ASSumptions. Most of these "mobile Yagis" give a 3 S-Unit increase over a single antenna. If you do not believe then try it for your self.

Dear Bill, KD6TAS,

I do not quite share your views about the well-being of the ng rec-radio-cb. It doesn't "piss me off" either.

It's plainly a place for the criminally-minded illegal radio hobbyists to meet, sell their illegal equipment, give each other advice on how to modify their radios to make them work in a way that no honest Cber would appreciate. Or a licensed amateur radio operator either, for that matter.

Having read your messages in the newsgroup I am only happy that I am not like you, dear Bill. I help the Finnish Cbers in other ways: I help them to study for their tickets and if they don't want to become hams, that's fine, too. I also assist them in understanding propagation, antennas and other matters of relevance to the hobby.

I quote you:

"I've got 3 Kris Big Boomers to unload. I might try that Epier outfit."

This, please note, is one of the least criminal type of messages from you, Bill. In the others you help the illegal "freebanders" to modify their rigs, power amplifiers, even tell them how to sell their illegal equipment to other users, especially if they have met with difficulties from the behalf of companies like Yahoo.

I wonder what makes a licensed operator go bad the way you evidently have gone? What happened to you? Were you treated badly in a pile-up? Did someone step on your toes with a bigger signal?

Hopefully you are not a "lower life form" you so warmly speak of in your messages above? What exactly do you mean by that term? Am I a "lower life form" if I believe in legal radio? You do realize that I came to rec-radio-cb with the only intention of trying to understand what people like you talk about when they talk about CB radio, don't you? getting there was really no challenge at all, even though Scotty and the others said it would be.

Furthermore, I do not regard coming to a newsgroup like rec-radio-cb as "graduating" - I would call it becoming "retarded".

For understandable reasons I won't sign the messages to you with a "seventy-three" - I only do so with fellow ham operators who believe in the great hobby.

Gary, oh8mfh
friend of legal radio

P.S. The other, childish abuse-type of replies from your CB collegues I simply ignore.

To learn more about radio and expand from there. Everything on this
Newsgroup is a forum. A forum of information. Because people talk about
radio modifications does not constitute illegal behavior.

My pick is number three...

I'm basing my observations on the people I see at the local ham club, at area hamfests, and who I hear (and know) on the local 2-meter repeaters. Maybe there are a lot of new young licensees - but the older people sure predominate among the active hams!
What I've noticed around here (Burlington, North Carolina) is a distinct aging of the active ham population during the past two decades. We had a lot more under-40 people on area repeaters 20 years ago - compared to almost none now.
Local repeaters are much less used since the Internet got big.

RCI really screwed up the new DX, on the old model all you had to do was
move a jumper
and depress the the reset button on the cpu for access to 26-32MHz.....
The radios usually needed realignment after the mod to reap the benefits.

Am i correct in thinking that the Connex Turbo Echo Board has a built-in
speech processor???
I read that the Galaxy board has this feature built-in their Echo board.
I wondered because i notice a distinct difference in audio when i turn-on
the board in my 2950,
Is my radio talking straight or am i hearing crooked????
The rig sounds beautiful always, just curious about the board i have.....

Greetings!

My selection? All of the choices, I cannot control what happens in the other parts of the world, but I do appreciate knowing we can all participate and hopefully get someone off to a good start in radio.

The bad side...

I can't prevent stupidity.

What we talk about is simple discussion, it's about opinions and tips/techniques to enable users to get the benefits of their system that they spent good money on.

That does include the bad side or grey areas, and I cannot control that.

I've made a reference in a post not too long ago, about the cafeteria aspect of CB radio. That is the best and most relevant term I can use. If we don't discuss *all aspects of this communication medium* here, in an open forum, in a fashion that trickles down to the correct answers, whom is to say what is occurring out there in the CB world on the air is correct?

I see hams out here on the net more than happy to slam someone for an amp abuse case, or the illogical society that stands out there in the free bands, but I don't see too many "elders" helping in here.

Maybe you should add another statement...

4. Would you be willing to contemplate that we are willing to teach?

I have always walked a fine line between that which there are extremes in this forum. Both sides, legal versus illegal, to me, it does not matter. I simply try to answer the question, and how I arrived to those answers is in the posts if at all possible.

I treat this forum on a one-to-one basis. Sometimes there needs to be a firebreak to release the tension and the endless mobius loops that can occur. This technique is also taken to the extreme at times and to the point it can violate the charter this NG is based on.

I check my guns at the door, and grab a cup of coffee or a can of soda and sit down and try to make sense of this mess people tend to generate over questions - left open to interpretations. It's a lot to wade thru, but sometimes a gem or two is found I do my best to lend my experience to someone else.

Sure, I get flamed for it, but this is my time, not anyone elses. If I'm wasting any ones time, it's against their clock. To me, this is just a place to drop a note or two, or answer in detail - the best I can, about aspects of the CB radio I am familiar with.

Don't lump me in with the rest of the group - I stand for what I know and care about. If my knowledge helps others, that's the purpose I've intended it to be. If someone abuses that knowledge, please remember I can't prevent stupidity and irresponsible behavior.

Might it be that both of you are right??

First off, Matt, you live in a greying population. There are lots of us aging boy wonders floating around (for reference I am 57). I am part of a demographic group called the Tweeners, too old to be a Boomer (the 1946-1960 birth bulge) and too young to be a WW2/Korea vet. We were destined never to hold power so we get to watch the Boomers act as if they are the first generation in history to turn 50. Demographics can be destiny.

This bulge going thru the snake like a pig thru a boa constrictor has had and will have many more effects on this society. One of which is to cause 'echos' in the number of births as the spike is damped and reduced at roughly 25 year intervals. No huge surprise you are seeing them at VE sessions, Kevin.

Every generation has its central theme. For my parents, it was the Depression and WW2: if ever a generation deserved a dignified retirement, they win. In my case, it was the Nam: but please remember there were so many of us that only about 1 in 8 actually served so Clinton's case was hardly unique. For those coming along which I assume means you the central theme may well be surviving the passing of the Boomers.

Personally, I think I would rather have a small war.

Dick N&#65533;BK

None of the above.

It is a window through which J. Edgar can observe the development of a
community without any social conscience, the purpose of which is to
identify common character traits which could be used for psychological
profiling of criminals, antisocials, anarchists, former presidents,
and people who don't turn off their cell phones in movie theatres.

Dear ng reader,
How would you understand the purpose of this particular newsgroup?
1. Its purpose is to talk about CB radio and help people work better with their rigs and antennas
2. Its purpose is to sell illegal equipment, shed some light on illegal radio modifications and so on
3. Your choice, please tell everyone about it.
My choice would be number one.

73,

Gary, oh8mfh

The purpose of a ng is to discuss and exchange information, and going by the topic, which happens to be "cb", it can be anything and everything even remotely associated with cb. I am happy you felt the need to share your opinion on what you feel the ng should be. Maybe you should search for a moderated one since this one does not suit your needs or meet with your approval. Ditto for everyone else that pisses and moans about content.

That sounds like a 1970's story. I've heard and been a part of many
similar ones. The close knit comaraderie that CB in the 70's had, seems
to be lost in the free-for-all that makes up CB today.

Having a surprise skip contact like that can be a real thrill. It's a
shame that so many people on CB get addicted to skip, and do nothing but
increase the noise floor for the rest of us, with their incessent skip

chasing. I'll be glad when the sunspot go back to their quiescent mode.....

Exactly! What something is "worth" to you, is directly proportional to
the effort made to obtain it.

>
> If it's too easy, it becomes boring too quickly.

Which is why I long ago lost interest in "chasing skip".

> If I remember right, the two Voyager probes used no more than a few

> Now THAT'S DX!

That's also line of sight, with little matter to absorb or reflect the
signal, once outside of Earth's atmosphere. I believe that the "V-ger"
probes transmitter ran about 10 watts max, but the antenna had more than
10 db gain, so the signal had an ERP of close to 100 watts or so.

So what's the problem, did Voobner quit responding to your threats? I don't understand why you would tell me what you are going to do to me ahead of time, unless emailing the threat is the only thing you CAN do. You couldn't even spell my name correctly, and I'm supposed to take it seriously? From a hotmail account? Putz.

> > once).

> I'm sure the SD1446 is just as 'tough' as the MRF455 and might even be a little
> tougher!

I'm sold! You are correct that the loss in power was due to the fact
that the'455 had less gain than the '477 it replaced. If a '1446 has
similar gain to the '477, then power output should be comparable. The
other option is to try to up the drive from the previous stage. At the
time, I didn't want to do that and risk stability problems. But I'm
sure, with the right parts and design, it can be accomplished, for those
who like to tinker. It doesn't become a cost effective mod for those
whose time is on the meter.....

Appears to me that a certain lot in Finland might be better off investing in some equipment with better rejection, or a better antenna system. I know for sure that the states do not come into your receive with the frequency and strength that South America and the islands come into my receive. There is a cure. Seems you would rather moan and troll than fix your problem. You probably aren't even on the air.

2287. Re: rec-radio-cb: Yahoo is getting crazy

Message-ID: <21701-3AC09E63-249@storefull-127.iap.bryant.webtv.net>
Source record: 76809

`Dear Bill, KD6TAS,
I do not quite share your views about the well-being of the ng
rec-radio-cb. It doesn't "piss me off" either.

"Sure it does or you wouldn't constantly troll like you do, or else you
just enjoy starting stuff, which in that case would place you near the
bottom of the gene pool with another of your species."

It's plainly

"To YOU, maybe."

a place for the criminally-minded illegal radio hobbyists to meet, sell
their illegal equipment, give each other advice on how to modify their
radios to make them work in a way that no honest Cber would appreciate.

"So, you are saying one that pops a clarifier or boosts a radio a few
watts has no integrity? You have been eating plenty of beef over there,
haven't you?"

Or a licensed amateur radio operator either, for that matter.
Having read your messages in the newsgroup I am only happy that I am not
like you, dear Bill.

"Funny, you don't sound convincing."

I help the Finnish Cbers in other ways:

"Great. Leave us alone."

I help them to study for their tickets and if they don't want to become
hams, that's fine, too. I also assist them in understanding propagation,
antennas and other matters of relevance to the hobby.

"Bully for you. So what?"

I quote you:
"I've got 3 Kris Big Boomers to unload. I might try that Epier outfit."
This, please note, is one of the least criminal type of messages from
you, Bill.

"Now THERE is some real intelligence shining through. You can not
differentiate between speech and actions. Sounds like you wish to
regulate speech."

In the others you help the illegal "freebanders" to modify their rigs,
power amplifiers, even tell them how to sell their illegal equipment to
other users, especially if they have met with difficulties from the
behalf of companies like Yahoo.

"And you again, demonstrate your problem with our free speech. That is why we are here and you are where you are."

I wonder what makes a licensed operator go bad the way you evidently have gone?

"I wonder what makes not just one, but two or three of you anal retentives on this ng care so much about another's actions when it is NOYB!"

What happened to you?

"What happened to YOU?"

Were you treated badly in a pile-up? Did someone step on your toes with a bigger signal?

"Now we are getting somewhere. Self-projected admission of what really happened to you."

Hopefully you are not a "lower life form"

"And I bet somewhere you will go on about getting personal, calling names, etc. Pot, kettle, black."

you so warmly speak of in your messages above? What exactly do you mean by that term? Am I a "lower life form"

"(Cough)"

if I believe in legal radio?

"Not at all. Just don't try to change anothers view. The regs in here know how each other feel. So why are you grazing again?"

You do realize that I came to rec-radio-cb with the only intention of trying to understand what people like you talk about when they talk about CB radio, don't you?

"Maybe. But then you didn't like what you found and attempted annointing yourself some type ambassador to Finnish cb."

getting there was really no challenge at all,

"LMAO!"

even though Scotty and the others

"Lower life forms (YOUR term) always look to others for blame."

said it would be.
Furthermore, I do not regard coming to a newsgroup like rec-radio-cb as "graduating" - I would call it becoming "retarded".

"That explains why you hang around so much."

For understandable reasons I won't sign the messages to you with a "seventy-three" - I only do so with fellow ham operators who believe in

the great hobby.

"Be careful. If it rains, you may drown."

Gary,
oh8mfh
friend
of legal radio
P.S. The other, childish abuse-type of replies from your CB collegues I simply ignore.

"Didn't have to wait long, did I? Pot, kettle, black."

<twistedhed@webtv.net> wrote in message
news:20906-3ABFAF0A-137@storefull-125.iap.bryant.webtv.net...
  "Not my style. Personally, I feel like he should have the right to
say what he thinks of me over the air, whether I like it or not, as long
as it is done without libel or malice. The public stating of one's mere
opinion, considering the source, is at best, folly fodder. Also, he does
not offend or bother me in the least."
If he's on the so-called freeband he has no more business being there
than the other freebanders.
"Sucks, but you got 'em."
Since he's on the so-called freeband we don't have to put up with him.
Guess that makes him your problem. 8-))

"Nah. Too many frequencies for anyone to be a problem for me."

  "Why even attempt an analogy? What's your point?"
The point that almost always seems to be missed is the Ham comminity is
interested in cleaning up our bands. You will even read it in the
various Ham news groups. Now on the other hand I don't see the same
level of interest expressed along those lines here in the CB news group.

"No. The point that is almost always missed is the HAM community, like
you just illustrated for all, is so determined on comparing and
analyzing cb to amateur when they are apples and oranges. You won't find
many cbers, if any, caring about what goes on in the hammie groups r
frequencies."

  "Yea! And my reply to this oft-erroneous statement is the same as
always. Like the Liberty Net?"
One day they too shall be gone, count on it.
  "My, my, erroneous AND mistakenly self-righteous."
I don't think so.
"Yup. On hammie freqs and cb."
So you do a little flip-flop there, from your "self-righteous" comment
to agreeing something needs to be done with the current state of 11m?

I can care less what they want to do with eleven meters. Part of the
nonchalant attitude is due to understanding the nature of the band. It
has little value to anyone, therefore, merits no interest or attention
unless a safety problem exists."

  "About what? Has it ever occurred to you that maybe, just maybe,
the hammies are considered more harmful than the cbers and that is one
reason why amateur enforcement exists and the FCC threw in the towel

with cb?"
The FCC went after Part 97 violations because Hams have been practically begging for enforcement efforts for a long while.

"Not even close, Leland. The cash influx enabling you much called for enforcement is due to pork dollars and nothing more. They didn't listen to the constituents, more often than not, it was a single entity with a contribution that asked a favor, for whatever reason."

And that is a fact.

"It is."

Now with a new head honcho running the FCC things may change for the better with 11m Part 95 violations. One of the E-mails I got from Mr. Hollingsworth leads me to believe that if he had a budget he would be doing to 11m what he has been doing on the Ham bands.

"Maybe so. But not in his reign of bureaucracy, and he knows it."

The attitude the FCC takes with CB/11m can change if enough people convince them it is a problem.

"No one cares but hammies, and the numbers aren't there. Most don't even contribute to the tax base anymore, they draw from it."

More and more Hams are getting sick of the yahoos showing up on 10m,

"I agree this is a bad thing and violators should be fined...heavily."

and elsewhere. This is not going unnoticed by the FCC. What ultimately gets done is anybody's guess right now, but something will be done, and maybe not entirely favorable to the 11m group.

"Nothing will be done, Leland. At least not for the next four to six years."

>First off, Matt, you live in a greying >population.

Heathkit used to have a store in nearby Greensboro - but Heathkit went under
years ago. Several years ago, ham magazines speculated about the problem of
manufacturers of ham gear having to make money while selling to a shrinking
customer base.
And most tellingly, you can get a good CB radio for a lot less than a good
2-meter rig. Manufacturers of ham gear are obviously having to charge a lot
per unit to make up for shrinking sales of units.

>There are lots of us
>aging boy wonders floating around (for >reference I am 57).

I'm 40 - but as such, I'm young for the area ham population, some of which
has literally died out.
I got in at age 21 in 1981 - and was one of the local club's youngest then.
Several then under 40 here have more or less disappeared from the area 2-meter
scene and from club meetings.
N4GSV,
Matt

"Not even close, Leland. The cash influx enabling you much called for
enforcement is due to pork dollars and nothing more. They didn't listen
to the constituents, more often than not, it was a single entity with a
contribution that asked a favor, for whatever reason."

Oh I think it's very close. From the on-line comments, the printed magazine
articles, and a few words with the Man himself by E-mail has convinced me
there is a real interest in Part 97 enforcement because it has been asked
for for quit a while, and now we finally got it.

"Maybe so. But not in his reign of bureaucracy, and he knows it."

He is new on the job, so we will have to wait to see what happens, and you
could be right anyway. Time will tell.

"No one cares but hammies, and the numbers aren't there. Most don't even
contribute to the tax base anymore, they draw from it."

I would have thought the bill signed by our ex-president Bill would have
been a wake up call. It doesn't really matter how many local cities enforce
the new law, it's the fact it got passed at all. I don't care about the
arguments about the FCC doesn't care, no money etc., but the fact that a
group of people got the ear of the local law makers good enough to get the
bill passed says the numbers are there. All that's needed is a rallying
point to stir things up again. I would not dismiss the chance that nothing
will happen off handed like that.

"Nothing will be done, Leland. At least not for the next four to six
years."

It didn't take that long for the bill I was refering to above to get passed,
so I would not be so sure it can't happen again in less time than you are
assuming.

Sparky, I believe talking to mexico city would not be legal, and you are a proponent of legal radio. I am appalled to hear such an admission from you..
1) Are you withing 150 miles of mexico city ?

Did you ever take into account the antenna that the voyager was transmitting to (Nasa has some big antennas Just ask Robert Piland) I am sure it was not similiar to the one that the voyager was transmitting from. So I would think it is the recieving stations antenna and the frequency that played a part.
Try to talk around the world on 144 mHz with 4 watts .. Sorry

If I remember right, the two Voyager probes used no more than a few watts to talk to the Earth when it was jillions of miles out in space.
Now THAT'S DX!

Matt,

Living south of you near Charlotte, I haven't noticed a dearth of activity on the local repeaters. Most of them, 145.35 for example, are usually buzzing with traffic, especially during drive time. All those drivers aren't 50+, either. I tend to agree with Richard McCollum that the seeming trend in the ages of hams somewhat parallels that of the baby boomers, of which I am a "member". I can't speak for Burlington, but this area is usually jumping with activity on the bands.

While you are waiting for the manual, pop the cover and trace the coil leads from the relay. Then trace the whole schematic. But please discharge the caps first; people who trust bleeders are known as dead.

Dick

How much of that is just due to Charlotte being a large metro area -
combined with the fact that in a large metro area, you're much more likely to
always have at least two people wanting to talk? Is there any way of knowing
how much busier - or less busy - Charlotte repeaters now are, compared to 10
years ago, and comparing that to population changes there?

2311. Washington NB/audio screwiness

Newsgroup: rec.radio.cb
Date: 2001-03-27 21:09:31 UTC
From: grtpmpkin32@aol.com
Message-ID: <20010327160931.07829.00000993@ng-ma1.aol.com>
Source record: 76835

Hi folks-
I've used a Uniden Washington for a couple of years now, and it works just great. Only problem is that whenever the NB is enabled, there is a faint hissing in the speaker. The other noises are attentuated nicely, but it adds this hissing noise and even when the volume is completely off, or squelch is high, I can hear this hissing. Kind of defeats the purpose if youo ask me. Also, when there is bleed-over present from some local yahoo running his beeps and boops and whatnot, it makes this bleed-over more pronounced in the speaker. I have heard that this is typical behaviour for a Washington, but I'm wondering if there is any way to remedy this screwiness.. I'd sure love to be able to use the NB without having it ADD perimeter/extra-circuit hissing!
Linus

Using a cell phone in a plane in flight is not allowed.
Some say it has to do with cell technology. I don't know the details.
I have heard that because so many cells are "visible"
when airborne that it can cause problems with the cell
switching. I don't know if that's true or not.

Twist,
Lelands does have a point.

No argument about his point that many want enforcement and something needs to be done about ten meter encroachment by non-licensed individuals. I just happen to base my belief that non-enforcement of cb radio and enforcement of amateur radio are two different discussions and attempting to lump them both together is of no value to anyone. It is always a licensed amateur attempting to do this and it is inherently incorrect. As far as enforcement on eleven meter, Leland and I have opposing views. He (among others) feels a long overdue third reich of enforcement against illegal cb operators is just around the next corner, while I believe the total opposite. No one cares except hammies, and the numbers are not there to carry any political clout, nor do the amateurs belong to any lobbying group that contributes any real cash so it (eleven meter)is a non-issue with them. It is hard to justify any real action concerning enforcement when the parties yearning for such enforcement are asking so out of personal inconveniences (he bleeds my phone, he swears through my TV, etc). Do you think they really care? We are entitled to believe what we will. I believe Leland is receiving well rehearsed lip service from an individual who in all actuality, may express an interest in doing something, and have the desire to do so, but is unable. We are soon going on half a year since that law was passed, how many towns across the country acted upon it?

2319. FS/FT: classic Sonar FS-23 tube-type CB base station

Newsgroup: rec.radio.cb
Date: 2001-03-27 21:40:44 UTC
From: k5dh@raytheon.com
Message-ID: <wN7w6.73$qf5.2883@dfw-service2.ext.raytheon.com>
Source record: 76841
Cross-posted to: rec.radio.cb,rec.radio.swap

For sale or trade: Vintage CB radio for the collector!

I am offering up my classic 1960s Sonar FS-23 tube-type 23 channel AM base station. The front panel looks GREAT, nice and shiny. The red plastic "Sonar" emblem is intact and the knobs and meter face are nice originals. The aluminum cover plate over the holes for the optional tone unit is missing (never had the tone unit, not sure why that cover plate disappeared, who knows). Transmitter works fine, but the receiver sensitivity is not up to par. I have aligned the set per the Sams manual and replaced some weak tubes, but it still isn't performing the way it should. It *works*, but the sensitivity is way down. The power supply has all new filter caps installed. The cabinet was repainted at some point in the past. It looks okay, but the color is lighter than the original, and it's getting worn looking. It's certainly presentable as-is, but it really should be stripped and repainted properly for a complete restoration. The radio is completely stock, with no modifications that I know of.

These old Sonar base stations were well-known in the "old days" for their great modulation (true high-level, push-pull audio!). They dual-conversion receiver with a Nuvistor front end, which provided excellent receiver performance with very high immunity to front-end overload. Plus, they just plain look neato!

The radio comes with the original AC power cord, the original mobile mounting bracket / base station tilt bail, the two original aluminum thumbscrews, a Turner "Plus Three" desk mic (in fair cosmetic shape, a bit scratched up, but it works perfectly), a quality Xerox copy of the original owner's manual and service information, and a Xerox copy of the Sams Photofacts manual.

Asking $65.oo plus shipping by your preferred carrier, and there will be no bogus "handling" or "packing" charges (insurance, if required, is optional at your cost, and I highly recommend it). I pack all of my gear carefully, with the assumption that the "gorillas" at UPS or the Post Office will try their best to destroy the package contents. I have *NEVER* had a piece of gear damaged in over 20 years of doing the buy/sell/trade thing, so I guess I know what I'm doing! I have, however, had packages mysteriously "disappear" during shipping, which is why I really recommend insuring them. :)

I will trade for CB radios and walkie-talkies from Raytheon, Apelco, Webster, or Allstate (certain models) for my personal collection. I guess I'd also like to have a pristine Heath GW-14 and matching p/s.

73,
Dean, K5DH

>You may see it as ILLEGAL but some of us dont really care !!!

Yep, freedom of speech allows people to act like imbeciles as well as heroes (and I'm not calling you either one...).
The fact that you don't care what's legal or not is merely indicative of a lack of respect for much beyond your own ass.

With two watts and a good antenna, I can cover the better part of a 20
mile radius. I certainly can't break the 250km limit with my ground
wave, and that was not my intention. But skip happens, and I would
support any attempt to loosen the 250km limit for that purpose.

>Did you ever take into account the antenna that the voyager was transmitting

>similiar to the one that the voyager was transmitting from. So I would think
>it is the recieving stations antenna and the frequency that played a part.

My point exactly. Why push 500 watts when you can do what you want
with just 4? Unless all you want to do is step on all the mudducks.
(The terminology that CBers have come up with is interesting. They use
'mudducks' to describe normal, decent people operating legally, and
'freebanders' are operators that show a reckless disregard for the
same laws that grant their freedoms).

>Try to talk around the world on 144 mHz with 4 watts .. Sorry

We are not talking about 144MHz, which everyone knows doesn't skip.
Regardless, you are not going to talk around the world with 1000 watts
on any freq unless the weather cooperates.

Well, I can't give you an "official" answer, but I have been licensed
more than 10 years, and all I can tell you is the repeaters were busy
10 years ago, and they are just as busy now. And I hear new people
most every time I listen to them. Lots of the regulars are young
married people, and some of the traffic *does* involve matters between
wife and hubby--"I'm gonna stop and pick up the kids", etc.

Naturally, there would be more activity in a large population center
like Charlotte. There are about 15 repeaters within reach of my station,
and they all get regular use some. of course, more than others. The
5.35 machine being the most popular.

Hi Gary (or Kari :-)

Can I ask (and I mean this in a friendly way, I dont want to be argumentative, I'm just curious), why is a bloke in Finland getting worked up about Americans breaking the FCC laws? Particularly when there is so much abuse happening in Europe.
Just wondering.

cheers
Jack

Heck, Sparky - despite me advice about putting the back to back diodes
across the modem to avoid excessive SWR from hitting the troll-o-meter, they
got me! Everyone knows that communications runs on smoke (look at the
Indian smoke signals!) - and that one let the smoke out of my components.
Had to replace the 1N4007s in the telephone line to protect the modem.

I was among the last of the Kennedy daddies, a big 3-A by 1969.
Considering that I got out of school in 1966 and in fact never had a 2-S
along the way or I would never have gotten the 3-A, and passed four draft
physicals, it took a lot of tap dancing. Just being in the right place at
the right time, nothing shady. Like I said, only 1 in 8 served.

Caused me a lot of guilt at the time but I didn't write the rules.

Dick

2m is not known for being a commonly used skip band. I should have
said, "doesn't skip very well". Please read it in the context it was
written.

How sad......a bigger engine to power the amps than to power the vehicle. If he had really thought things out, he should have used matching engines. That way, if the one that powered the amps died, he could always pull the other and swap it out. Gots to get dose priorities straight!

I haven't twisted the meaning of anything. I've quoted exactly want you said, and I've quoted exactly what the regulations say. In other words, don't blame me if those two (you words and the rules) conflict.

> [snip] I know what the rules are maybe
> you should Call the FCC instead of
> assuming what you think it should be...
> I have been a ham since 1978 I have
> been thru this while you were in Guam
> or something .

Well, since I've already said that I would never use a CB radio in the ham bands, I don't really have a need to contact the FCC. However, before someone else does use such a radio, I would strongly urge them to check the rules before doing so (and contact the FCC if doubts remain). Beyond that, any further discussion is pointless - you're unwilling to accept what the rules specifically say, and you're certainly not going to accept what I say, so the conversation is effectively over.

No, Kevin, I'm not forgeting that ham radio equipment doesn't have to be certified. In fact, I've addressed it several times in several messages. And, I'll repeat that I've told others, you cannot take the sentences from 95.607 above out of context, ignoring the the restrictions on who can modify a certificated CB. However, thanks for your input. See you in another discussion, some other time.

Dear William:

As a frequent visitor to VE land, the differences are such:

Canada US
1. BASIC Licence Technician License
(no code VHF and up) (No code VHF and up)

2. with code (5wpm) with code (5wpm)
160, 80, 10 meters (cw only on 80, 40, 15
code and phone phone on 10) (SUBBANDS)

3. (12 wpm)
phone & cw GENERAL CLASS (another exam)
ALL BANDS, 250 watts
no homebrew

4. Advanced EXTRA CLASS (another exam)

The border is invisable to radio ops, open reciprocity
for Amateur Ops.

No subbands in Canada but they do exist in US.

That's it? You spend two days trying to find something to support your
position, and when you can't find it you just call the game off?
That's playing it like a little kid -- "I don't like this game no
more" as he throws the pieces all over the game board. I now have more
respect for CLP, at least he stayed with his guns as they were
melting.

Well then show me where in the rules that contradicts this:

>> Anyone can apply for certification
>> of a radio frequency device.

I should amend that to say, "anyone that qualifies as per 2.909". And
what part of Title 47 deals with "uncertification"?

> Since you're unwilling to accept what
>those regulations specifically state, the conversation can go no further.

I'm willing to accept the regulations. But I'm not going to pull
anything out of context, either. Such as part 95 subpart D, which are
rules in context with the operation of a CB station. Or part 2 which
deals with the authorization of all radio frequency devices.

So if you can correctly answer those two questions above, I am
perfectly willing to concede those points.

You would be better off taking it down a tuning it up properly. The matchbox will work, but not as well as if you installed the antenna correctly. If you went to the trouble and expense of buying and installing a decent antenna (no flames, please), you might as well get the most out of it.

Hello Everyone
I have decided to try CB'ing after being out of the sport for about 5 years. It sure seems different.

I purchased a Radio Shack brand CB (on sale) to get started, with one of those new anteneas that looks like a cell phone antenae that attaches to your window. This seems to suit my needs pretty well for the moment.

I am currently looking into purchasing a Galaxy Radio. Does anyone have any suggestions as to which is the best? Also -- What would be the best antenae to get??? I am concerned about messing up the paint on my car with a magnet mount.

If you are ever in the Kansas City area, give me a hollar, I will answer if I am on. The handle is Fluffy Kitten.

Oh yea, I live in an apartment and wanted to check into a base station but was kind of afraid of that because of neighbors and the issue with the antenae, does anyone have any suggestions on this?

Thank you so much in advance....
Fluffy Kitten

All those out of staters... Maybe I'll catch you in the "SKIP ZONE"

You make a better point than you know. For blood-and-guts point-to-point communication over crappy terrain the best frequency is about 35 MHz which is why hiway patrols for many years hung out there. Anyone remember Broderick Crawford telling us to leave our blood at the Red Cross, not on the Hiway as he stood in front of a clipped-down Lo-Band antenna?

For a lot of purposes Lo-Band (30-44 MHz) is the best kept secret in radio. Like CB it does open in high sun-spot years and gets the seasonal sporadic E skip. It was fun to hear the Missouri Highway Patrol and the Ontario Provincial Police coordinate their activities when the skip was in.

The Big Island presents some shall we say unique communications problems. Keep up the good work.

I gotta admit it, Scotty: I agree with you. My favorite band, 144-146 megs gets you out real nice, up to distances exceeding 2,000 km, with various types of propagation (meteor scatter, Sporadic E, extreme tropo, to name a few of the juiciest). With output power not necessarily more than 20 to 50 watts, even into a single, preferable long yagi.

Actually, my ignorant Cb friend, you haven't heard of monitoring stations
all around the globe, working for ITU, whose main job is to keep the
intruders out of the bands. It doesn't give you (or me, for that part) any
special priviliges to use illegal equipment or excessive power.
How can you explain that I've been able to copy US ham stations with 300
milliwatts of output power? Right here in the middle of the "sheep country"?
BTW: Nokia is a Finnish company, beats the shit out of Motorola any day. The
percentage of computers per homes is of top global level here, too. We Finns
study foreign cultures at school, also foreign languages. You can carry on
with your bullshit now. Go check on your valves in the cab, taxi driver.

Then what are you doing in a CB ng? Of course I was referring to obtaining a ham ticket of some sort - I understand that they are not that tough to get in the U.S. Then you can use a linear, directional antennas and such. All you have to do is to study a bit. The choice is yours.
>
> In other words, you can never study enough to ever *legally*

Hi there (or G'day, mate?), Jack, long time no sea...
The same as before: the CB bunch come to ten meters, ruin the beautiful band (my favorite after two and six meters). They do not understand that we can enjoy the intelligent garbling on southern accent coming from a trucker in Georgia, who doesn't even know (or doesn't give a shit about anything) he is on ten meters, let alone that he is destroying a QSO on CW between two hams (or several, he's of course using "an amp").
The disaster we have in Europe would be about the same, wouldn't you say? Having read about the gear the Brits use on their "CB" (NB: I'm not talking about legal CB): at least the CBers here and in the British ng understand English, which the Arabs, Italians, Polacks, Russkies and so on don't - so we can at least talk, sometimes, even in a civilized manner. An Arab CB station from Lebanon told me that he can do whatever he wants in his own country with his own radio. I was desperately trying to copy a VK station, using only a few watts on "the up a few clicks CB channel", around 28.050 or so.
Some things change, others don't. How're you doing, anyway?
My ham courses and talks with the local Cbers have produced half a dozen new callsigns which begin with an OH8 :-))) - this year.

73, Gary (my net and ham
handle), or Kari, oh8mfh

Well Richard how about talking with all those Hams who like to restore classic boat anchor rigs? Some of them don't do anything other than CW and AM. Would be nice if you didn't need an old rig to talk to another old classic rig. 8-)) Ever check out the top end of 75m at night? Even around my area there are few guys who still do 6m AM. Guess what some of those nice Heil Goldline Studio mics get used on. Some of the AM operators take great pride in getting broadcast quality audio out of those old classics.

I attempted that one about a year ago. It worked to a large extent but it also cut the highs off of the audio I DID want to hear, and I felt it was too extreme for permanent installation. However, I can certainly try it again, maybe with some variable circuitry to find a balance...?
Thanks for the input-

You didn't really think they would include it for free did you? 8-)) Some of the new rigs need a separate IF filter just for AM. A good example of that is the Yaesu FT-100. A number of users have since discovered that the AM produce by that rig sounds like crap unless the "optional" 6Khz filter is installed. That costs a few coins. Of course even if there were no "extra" parts used to get AM out of a new rig, the R & D costs have to be recouped somehow, that allowed the reduced part count design in the first place. There's no free lunch. Over all the new ricebox radios do more per dollar than many of the golden oldies ever did. When we finally get to the point of software defined radios we just may get to the point where extra features can be added at no hardware cost. That would of course assume that some Ham(s) would design the new software, and publish it for free use by all. It could happen. When? Your guess is as good as mine.

Seems like a good enough reason to buy Ten-Tec to me. It has never made a
whole lot of sense to me to run a data mode by pumping it into the mike
jack and out the speaker jack thru a lot of trash to a compooter. It has
never made a lot of sense to activate computer circuitry thru big knobs on

a little case (although Ten Tecs Jupiter makes a liar out of me). The time has come to make that transition.

You may have noted a recent thread on the shortwave newsgripe in which a software guy did just what you are suggesting, in his case a pseudo-synchronous detector, on a TT SW receiver.

But no TT rig runs AM. Hmm

Dick

Source record: 76887

Greetings!

When you use the squelch, you can hear this noise? Then don't readily blame the NB. If you've had problems from the NB section, it would be squelched also.

You might be "hearing" the IF noise that is present all the time, the hiss occurs from several different sources.

Noisy diode in the NB circuit, although rare, not impossible.

Pre-selector over-peaked, this section can generate noise simply due to over-tuning this section, the IF is not supposed to be heard but in itself is a self-generated carrier internally in the radio. The NB, being a simple detector and high speed switch, is forced to sense this and does it's best to try and remove it. It's a simple threshold problem.

Other parts of the radio could also be generating this hiss, and the NB strip just makes it more pronounced.

Check ANL section, output of last stage IF to AF detector, the "twin coil" section. L12 - L15, these coils are for two types of IF detection, one set is for SSB and is centered around the SSB IF, while the other set of coils is for the 455KHz AM. The slugs for AM are the "large flat" slugs while the SSB IF is the smaller slug "flats"

Check C47, an electrolytic cap, it's the ANL cap. You might want to replace this cap with a Tantalum of the same value 1uF 35V - this cap is wired reversed polarity in the circuit for limiting negative going spikes present. It also offers working RMS value to the ANL diodes' [D23] bias which in this scheme, is forward biased.

I've worked on some Washington's that specify a Tantalum, but seen an Electrolytic used here instead.

Age of the chassis and the type of abuse it has seen is also a culprit.

Check the NB circuit to see if the noise is heard while in SSB. If it is, suspect the noise from the NB circuit or the pre-selector/front end section. Try a re-tune and if anyone did any mods to this section to improve receive or rejection figures, suspect that the coils or mod may cause this and return them to original values.

Under normal operation, the TP [TP6] should be tuned to show 2 volts with a 50-70uV signal present - re-check the TP to

see if this is the case, and re-peak if necessary.

3 FETs are used, for mixers, squelch, and Xtal-controlled passage of
the IF information. One is a dual-IGFET - did you have anyone using
high power or static discharges that hit your needle pretty hard? It
is possible that a puncture thru the substrate of one of these devices
is causing leakage. Even working on the radio can do this type of
damage.

Furthering that, the PIN section uses bias generated from
the last stage of IF detection, and the AF amp section.

PIN diodes, D12-D14, use the RF gain control and this output
section to control and limit noises entering into the 1st
stage RF amp. Noises heard from here, in this section, are
more like popping sounds when a weak carrier is present at
the antenna. The junctions of the diodes, when they reach
forward conduction - makes this snapping/popping sound.

My guess, is you may have the unit over peaked and the L12-L15 section
is really the culprits causing the hiss heard when the NB is engaged.
Re-check the work done to this section and re-tune accordingly.

The tech may have simply over tuned the coils.

Darrin, as Doc says, it probably doesn't matter at all. The likely reason you get the lower reading with the extra 50 feet of coax is that you have an extra 100 feet of loss for the reflected wave (you loose forward power for 70 feet, plus the reflected wave from this reduced power is reduced again for the second trip throught the 70 feet of coax). The reduced reflected wave is being compared at the radio to the full forward power and it makes the reading appear lower. The other radio only looses forward power for 20 feet of coax and the (less reduced as opposed to the first example) reflected wave is reduced for another 20 feet running back to the radio. 40 feet of lose for one radio, 140 feet for the other. This will likely not be noticed at either your end receiving someone or at the far end where your signal will not be reduced enough to notice. It just makes your SWR indicator happier!

Don't know about the hiss but the increased bleed over is normal for a
NB. When around a high signal strength on or off frequency station it
is best to turn the NB off.

The NB varies the amplification of the IF. This amplifier as all
amplifiers can exhibit nonlinearity. When a strong off frequency
signal is present it can mix with the desired signal. The mixing of
the desired frequency and the strong off frequency with a non linear
amplifier will cause undesired on frequency signals. This is called
intermodulation. Typical noise blanker IM distortion specs are 8db
below that of a non noise blanker radio.

Source record: 76892

Okay heres the deal, the A99 is a touch too short for the Citizens Band.
Their are 3 sections to that antenna, the supplied washers must be used
between the sections
or it will be way too short.
The variation in SWR readings is being caused by #1-cheap coax and
connections.
#2-moisture getting in the coax and/or connection. #3-moisture trapped in
antenna.
I hope you did not seal the drain hole in the bottom of the antenna (oops).
Replace the R/S coax with RG8-X and Amphenol PL-259 connectors, seal the
connection at
the antenna w/mastik so no moisture can leak in and short the coax.
Mount he antenna where it is free of nearby
obstructions-power-lines,tree-branches,etc.etc.
You must ground the antenna, if it is roof-mounted get the aluminum ground
wire from R/S
attach one end to the base of antenna and the other end to a 8ft. ground rod
buried 7.5ft. deep
in the earth. Adjust the tuning rings to the middle position and check SWR,
If the SWR is
high on 40 and low on 1 the antenna is too long. If the SWR is high on 1 and
low on 40 the
antenna is too short, adjusting the rings down lengthens the antenna and
adjusting the rings up
shortens the antenna. Hope this helps . You must have patience, the end
result will far outweigh
the hastle.
The object is to have no "bars" appear when you key the mic. Good Luck
(youre gonna need it)
Let me know how things turn out for you........

I have not spotted that thread on the SWL news group yet, I don't hang out there that much. I think we may see more software radios show up if the FCC ever gets around to giving us a LF band, around 136/137 KHz like they have in the UK. I think those guys are using direct conversion receiver designs, where the IF goes straight in to a DSP board, or desktop computer, which does all of the tuning, filtering, and demodulation work. Some of the switching type transmitters they use look a lot like the power inverters I help to design for my employer. The smallest one was a 2.5 KW job running between 50 Khz and 200 KHz depending on where the load was tuned. And all I used was two small brick FET modules to get to that power level. This band would be a good area for experimentation, finding an efficient way to use that narrow band to communicate.

>My guess, is you may have the unit over peaked and the L12-L15 section
>is really the culprits causing the hiss heard when the NB is engaged.
>Re-check the work done to this section and re-tune accordingly.

A lot of great information, thanks Andy- (and I did understand all of it, too!)
This last time around (I haven't opened the radio in over a year) I did
precisely this re-tuning of that section, to no real avail. If I got the hiss
subdued (and it does happen regardless of the squelch setting) it brought the
rest of the 'good' levels down too far for comfort. And still there was some
hissing. It's mild though, and with the latest alignment it's really performing
beautifully otherwise. Maybe I shouldn't complain too much!
On the other hand, I noticed this behaviour in the Washington long before I
ever had the radio on my workbench, or anyone else's. It bought brand-spankin'
from the factory and still made that noise before any modifying.
But I am now armed with everything you've written here, and will attempt the
suggestions you've made which I have not yet done... and again, I really
appreciate the help Andy-

10m is my favourite band too. But if I was you I'd only bitch about CBers who actually do use 10m, who I am sure are in the minority. Most HR2510 owners are breaking the law, but do respect 10m.
The 10m piracy situation in Europe is bad, but its much worse here. We get the asians here, who completely fill the CW section. Sadly not much we can do about it.

Dwight are you really that stupid?
If you modify the cb radio it is no longer a cb radio. It is a transmitter and a reciever you are so hung up on names(cb radio). You don't want to be proven wrong so you won't make an effort to call the FCC field office. Ill even get the number for your local office for you.
What do you say, Better yet how about I call I'll use your name and record the conversation and play it back for you?

Yes, I was referring to the Stargun type beams. The setup you showed in the jpg would undoubtedly work, as it based on classic yagi design.

P.S. What was the reference to Plano about?

You must be referring to the Stargun mobile beam. That thing is a joke apparently you have not seen enough mobile antennas to know. Here is a link to a picture of a mobile beam that is very directional and if you leave Plano and get a look around you might see one for yourself.

Short answer: no one cares because it is 100% legal.

There is nothing illegal about modifying a rig blessed for one purpose to do another purpose so long as the ability to do its original purpose no longer exists. As you point out, amateur gear does not require pre-blessing. The whole bone of contention here is the assumption that a certified rig acquires some sort of don't touch halo in the process and therefore requires some sort of dispensation or ritual cleansing.

Set the radio on ch. 20, select the SWR calibrate function on the SWR meter,key the mike and turn
the SWR calibration adjustment knob until the needle rests below the Red arrow that points downward.Unkey the mic. and select the SWR function on the meter, if it moves past 1.5:1 the SWR is too high. If it reads at or below 1.5:1 youre in good shape.At this point you can switch
between 40 and 1 to read the SWR to see where it is higher or lower. SWR means Standing
Wave Ratio or the amount of power being radiated off the antenna versus the amount of power being forced back into the radio.It can also be viewed as a Impedance mismatch since SWR and Impedance are directly related, a source (the radio) cannot deliver full power to the load (the
antenna) unless the Impedance of the load matches the Impedance of the source. This is what a
matcher does, it fools the radio (source) with a 50ohm Impedance so it delivers full power to the
antenna (load). Tuning the antenna is much better than using a matcher.....
Hope this helps Don.

2447. Re: Washington NB/audio screwiness

Newsgroup: rec.radio.cb
Date: 2001-03-29 08:54:34 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <bks5ct0ks2fgnk4s898aco6uhl1ldfpmlj@4ax.com>
Source record: 76972

Greetings!

One of the bigger problems, and it deals with the NB circuit, is the "shot noise" that is present. This is from the last transistor in that stage, that works the output side of the pre-selector before the IF Xtal pass.

This is why I call it a "threshold" problem. There is no real easy fix. This is the inherent fault of the transistor, TR8, it's a 2SC945. These are audio amps, not very high speed switches. What this part does in trying to "punch holes" into the IF strip of the pre selector - is actually making the noise you're experiencing. The noise though, only occurs with the squelch off, because it's noise present in the IF section, it doesn't go past the squelch stage when the squelch is on.

There may be a problem further down the line, it's not a big deal - but it may have to deal with the audio amp, the TDA7222P. There is a mute transistor that turns off the speaker when you transmit. This isn't the problem, but is involved in the "chain" past the squelch circuit, even the tone switch is involved in this chain.

Which brings up that next test. Check the "hiss" with the tone control, if that Washington has one. With the squelch on, listen to the tonal noise, does it change? If so, then the culprit is not the NB - it's within the squelch circuit or the chain to the audio amp.

If it doesn't change, then the culprit is within my notes below.

I own Grants and 148's that have this predominate "hiss" that you're talking about. The quest for holding down the noise really is in the audio chain, not the NB - there are two different types of noises that the radio can produce with no signal - noise from the audio chain, and the NB. The NB side can be squelched, or even RF gained out, but the remaining hiss is dealing with the TDA7222P and TR45 - an audio amp, C232 and the location of both.

Bias to TR45 and C232 role in muting, I changed the cap to a Tantalum - it doesn't help much but it didn't hurt either.

The last component that I remember "dabbling" with, is R258 - it's a 1 Meg resistor by TR53. I remember using a lower value to see if it reduced the hiss - some success but it will also affect volume and tone. I tried a 560K here [1/2 value] and the hiss was still there, but not overly abundant as before. Which led me to believe the Q-point of the TDA7222P was the real culprit to the noise present.

Hope this helps answer the questions. Yes, the NB does "inject" it's
own noise, along with the PIN's and those dog-gone FET's - but the
real culprit deals with the TDA7222P. It's not a big deal, as said
earlier - just you need to know that the best methods are simply to
change/adjust the tone, or leave it alone.

Greetings!

You're pretty much done, it's still a "tad" short, but kudos!

Hint: Channel 40 is a slightly higher frequency than channel 1, or
it's a shorter wavelength - so the A99 is showing to be better at the
SWR game on shorter lengths than on the longer ones in the CB band.

But, GAWD ;-) - we are splitting hairs here!

Lock and load, before it breaks or you strip a nut on a clamp holding
the antenna to the mast! It's not worth the further hassle - get a low
pass filter and install it close, in-line with the section that goes
out the house to the antenna, instead.

Only if you feel the need to reduce RFI issues. It's a good ideas
anyways when you have a base set-up - at least you're covered!

Now first of all this is in no way directed to any one that has sent me helpful replies etc.

I don't understand why some of you feel like you must comment on something that isn't your business! well I Guess it kinda is your business, but not really. Any way I ask a simple question and get replies like "that will make you the envy of every 12 year old" etc. Who gives a damn if you like what I like or not! there are allot of people out there that use echo (for instance) for a simple enhancement to there own voice, it makes you sound that much louder and also that much clearer (if set right). So what if allot of people play with them and key up for fifteen minutes while saying "echo, echo, echo" etc. that's there purgative, besides who (who has one) doesn't play around every once and a while. Like they say "every man is a kid at heart" and "boys will be boys". But back to the original purpose of this post:
I think some of you guys need to figure out what the hell is going on out here. These people (most of whome you don't like) are not going away, most of them agitate you simply because they can, they have figured out how to push your buttons and as long as you let them they will keep pushin'. If you were to ignore the stuff you don't like (let the fcc deal with it) then you might have an all together better experience, here, and on the radio.
One more comment:
It is my belief that most of the people that I am speaking of are hams, isn't that why you got your license any way, to get off of the cb freqs? I mean we all know that 11 meters is full of nothing but childish morons that wouldn't know there dick from a doorknob right? Well if that is the case and you expect it from them, why did you come to a news group with the letters cb in it (rec.radio.cb)

DUH!

Thanks
BC

M U D D U C K C E N T R A L ,
and I'm gettin' up!

2453. New info about LE

Newsgroup: rec.radio.cb

Tonight I got pulled over in front of my own house. They (the cops) gave me a sobriety test, which I passed (I don't drink). After questioning them many times as to why they pulled my over, I was given no answer. Instead, I was given a ticket for failure to signal a lane-change. While driving home I was being followed by my girlfriend, who witnessed me signalling for all lane-changes.

In the process of ticketing me, many drivers sped through the arterial I live next to. This was clearly visible (50 yards) to myself, my girlfriend, and the officers. The officers did nothing. After questioning the officers as to why they pulled me over, they called for a dog. I waited for 40 minutes in front of my own house for the dogs to find nothing (I don't do drugs, either). I was given a ticket, and a warning about driving in a known drug-infested area (an area in which I live, and an area where the police do not respond).

After the incident last year, and considering what happened tonight, as well as several other unmentioned incidents, I no longer respect local law enforcement. They will receive from me nothing but grief. I will interfere with their broadcasts. I will file false reports. And I will do everything I can to hinder their efforts to enforce false justice.

So why is Spokane's local law enforcement different? Ask the Wall Street Journal.

Run your amps. Tweak your radios. It doesn't matter, because it's all political. Money runs the country, not justice. Anything anyone can do to thwart the power of money, I support. If it brings attention to the corruption that is happening here, or anywhere else, I'm all for it.

Sparky, Friend of Legitimate Civil Disobediance.

Adrian,
I'm not sure what you mean by the power lvl control not operating at full power at the minimum setting, it isn't supposed to. It adjusts the power output, nothing to do with the mic-gain or ALC. The 'ALC' reading will increase as power is lowered and that's normal. Simply reduce the mic-gain as I think your doing.
Adjusting the power output (100w instead of 90w) is a simple adjustment and is outlined in the service manual.
The TS-850 is THE best transceiver that Kenwood ever made as it is. Don't 'screw' around with it!
'Doc

BTW, this is referring to the 318, which originally came with the
poly-head. They changed the head but not the angle of the lifters, and
that's why you don't see the 273/318/340 in many hi-rpm applications -
the pushrods get warped. That's crappy engineering.

Not a good Idea. I don't know if you keep up to date with things but what you propose to do has been done before, and the perps get caught. In fact in several cases some local Hams polished their DFing skills by tracking down the people, doing the above, as a public service. You don't think the FCC doesn't do anything, just wait to see what happens when you get nailed for screwing with police comms!!!

> there are allot of people out there that use echo (for
> instance) for a simple enhancement to there own voice, it makes you sound
> that much louder and also that much clearer (if set right).

There must be something wrong with your hearing. I doubt it's the echo that helps, more like the mic rolls off the low frequency response. It's a known fact that most of the "intelligence" is contained in the higher audio frequencies. In fact some of the better communication grade mics have a bump in gain of 6 to 10 db around 2 Khz, where the ear is most sensitive frequency wise.

> So what if allot
> of people play with them and key up for fifteen minutes while saying
"echo,
> echo, echo" etc. that's there purgative,

Inconsiderate because it ties up a channel for miles around that other people could be using for something more productive like talking to another operator.

> besides who (who has one) doesn't
> play around every once and a while.

Same comment as above.

> Like they say "every man is a kid at
> heart" and "boys will be boys".

Yes, but most learn manners later in life. The ones who don't keep playing sound effects on the air deliberating tying up the channel so nobody else can use it near by.

> It is my belief that most of the people that I am speaking of are hams,

You have any facts and figures to back that up?

> isn't that why you got your license any way, to get off of the cb freqs?

Yes for many, but we still tune in now and then.

> I mean we all know that 11 meters is full of nothing but childish morons
that

It has nothing to do with how big your amp is, it is a test of who has put together the most directional antenna system in a mobile. It is no different then "field day" for the amateurs who drive all over the country to see how people they can contact in DX in a set amount of time with a set amount of power, kind of comes down to how good their antenna is performing, quite similar huh. The only difference is peoples opinion. I know you are going to whine "but hams do it legal". but when you made fun of a CBer driving across the country you did not mention legalities so don't do it now.

Body handling: HTML body converted to readable text

Heathkit went under because they took their emphasis off of kits and the kit builder and tried to get into the computer market. They couldn't produce a decent computer kit so they tried to get into the PC market which was cut-throat at the time. They went the way of Osborne, Atari, Comodore and a hundred others that were around at the time. If they had stayed with kits and only kits I believe that they would still be around today. It's a shame that many of today's ham operators are nothing more than appliance operators but ham operators aren't the only kit builders out there. I remember when the sold kit televisions, kit clocks, kit airplanes, and kit everything that you could think of except for microwave ovens. Heath's demise had nothing to do with "aging ham operators" it was their venture into the PC computer market that killed them. I've been a ham since I was 15. I too am 40 and expect to be around at least another 40 years, God willing, and I'll be hamming it up all the way.

2482. Re: FCC Rules Part 95, Subsection D

Newsgroup: rec.radio.cb
Date: 2001-03-29 15:25:55 UTC
From: "Kevin Muenzler, WB5RUE" <wb5rue@arrl.net>
Message-ID: <7ulw6.7536$aP5.637128@newsread2.prod.itd.earthlink.net>
Source record: 77107

I haven't taken any part of 95 out of context. I could post the entire thing here and it wouldn't change the fact that you can take a certified radio from any other service and modify it for use on the ham bands as long as it meets emission and power requirements. What part 95 is saying is that you CAN'T modify a CB BECAUSE it voids certification. If you void certification then you can't use it on CB. That's it, nothing else. I've modified countless Radio Shack 4 channel xtal controlled CBs for use on 10-meters and sold them at flea markets. This was back in the late 70's and early 80's when the FCC had teeth and was looking for illegal CBs. I'm sure I've cased by more than one FCC agent because several guys at the flea market where I was were busted by the FCC for selling illegal amplifiers.

As far as the rest goes, it appears that the discussion has degenerated to personal attacks. I'm out.

>I don't understand why some of you feel like you must comment on something
>that isn't your business!

Then never use the Internet newsgroups because that's pretty much what you'll find everywhere.

>well I Guess it kinda is your business, but not
>really.

Convincing...

> Who gives a damn if you like what I
>like or not!

No one cares. Just like no one cares that you get your buttons pushed by people who don't understand your desire for echo or what have you... it's all subjective.

>there are allot of people out there that use echo (for
>instance)

True enough...

>for a simple enhancement to there own voice, it makes you sound
>that much louder and also that much clearer (if set right).

To each their own opinion...

>So what if allot
>of people play with them and key up for fifteen minutes while saying "echo,
>echo, echo" etc. that's there purgative

(Well first, a purgative is something one takes to induce bowel movements. I'm sure you meant 'prerogative' but in the context of the post, purgative is appropriate)...
Secondly, the attitude of 'so what if people to stupid things' is noble but flawed. Yeah, hey, so what if I find you on the bands and key up with noise and nonsensical echoed ramblings while you're trying to hold a simple conversation... so what if I run ridiculous amounts of power and bleed all over your radio when you're trying to enjoy your hobby.
It's my 'purgative', right?

>Like they say "every man is a kid at
>heart" and "boys will be boys".

Ah yes, the apology for stupidity.

>most
>of them agitate you simply because they can, they have figured out how to

>push your buttons and as long as you let them they will keep pushin'.

Well it sounds to me like you've been *promoting* the idea of letting anyone do whatever they want to on the bands, and then telling those who don't like what they hear, that it's somehow THEIR fault that it's happening.
Get real.

> If you
>were to ignore the stuff you don't like (let the fcc deal with it)

You haven't been around the CB scene for long, have you? The FCC?

>It is my belief that most of the people that I am speaking of are hams,

You're entitled to your belief, no doubt, but I don't think it's based on reality.

>isn't that why you got your license any way, to get off of the cb freqs?

At least half of the hams in my area were CBer's first, and still operate on CB... the two are not 'mutually exclusive' except to those who like to trash the CB bands and gripe that only the hams dislike it...

>I
>mean we all know that 11 meters is full of nothing but childish morons that
>wouldn't know there dick from a doorknob right?

Hardly... I've made a lot of friends on CB (even those who use echoes and beeps, to ease your fears a little) and while there are idiots out there, the majority of the time I truly enjoy a relaxing and fun hobby.

>why did you come to a news group with the letters
>cb in it (rec.radio.cb)

Because I'm a CBer...
Live and let live doesn't work if you end up complaining about the livin'....

Linus

That old tube mobile was one of the very few amps that were actually FCC type accepted for use on 11 meters, and it's output tuning range should include 10 meters. (there was no input tuning)

They had serious power supply problems that would cause them to overheat and self-destruct their DC to DC converter transistors. (thermal runaway)

The fix was to add a relay to switch the DC to the converter and not let it run all the time, but then it was no longer type accepted.

The amp had trouble handling a 5 watt input and would be under a serious overload condition at 20 watts input.

That amp's only asset was the fact that it was FCC type accepted.

Kevin you sure have a self centered attitude for a young man. With your tenure in amateur radio one would think you are a GOD by now from your post. Heck, your just a young squirt compared to some of us. I'm 62 and have a life time in radio, and there thousands of others out there just like me. And we're NOT appliance operators.

I know from experience that Heath Kit employed people that thought the world revolved around themselves also. They hired a Ham Extra that was 21 yrs. old that thought he knew more than everyone else and got himself fired from a job because he didn't want to do what the customer paid for. That company lost a big customer because of it. Then Heath Kit hired him.

Hi John,

I have a 300m myself, just purchased off ebay because it was one of my first amplifiers way back when. Yes, it will deal with 10 meter SSB, but you'd probably want to add some delay to the tr relay function. It is an original FCC Type Accepted Amplifier for operation from 26 to 54MHz. It will operate AM, FM and SSB.
Operation at 10 might require a retap of the output tank coil. The amplifier has a low pass filter inside, I'm not sure if it minds going up to ten with a rework.

Don't drive it with more than 4 watts max... You might consider a 12 volt fan when you operate it. Dennis mentioned it had thermal problems... not really, it should have a fan though as it's not a continous duty amplifier.

Also, don't expect a lot out of it or its similar cousin the Sonar BR-21 type amplifiers. On a good day with a tail wind, hope for about 40 to 60 watts output.

It's a good amplifier from the folks back in Cedarburg, WI...

If you even want to sell it, keep me in mind.

cheers

No, keydowns are not a hobby "like ham radio". Ham radio is legal. The object
of ham radio is not overpowering other stations.

No matter how much you try to pretty it up and avoid the truth, you cannot escape the fact that keydowns are ILLEGAL. What you do is ILLEGAL. Your hobby
is ILLEGAL CB.

Huge, whacked-out CB amps are AGAINST THE LAW. Your half-assed directional antennas and alternator hookups DO NOT ADVANCE THE STATE OF THE ART (unless we're talking about the CRIMINAL art).

Face reality.

(Except for you, Twistedhed. You're too far gone)

Mike,

There is no service manual available for radio shack radios.
However you may be able to find the service manual for the uniden
pc-122.
The 453 was just the 122 with altered cosmetics for radio shacks market.

Try:

http://www.uniden.com/

P.S. I don't knoww what the problem is but if you would like to have
it
professionally repaired and serviced just let me
know.....................

Good Luck........
73,
NAO911/Jack

HAHAHAHA, They are trying to put up a special bond for election. Some
$40m just for roads. If they could spend their money wisely to start
with (i.e, parking garages, pet projects) they wouldn't need the bond.
Which is now going to have a super-high interest rate because of the
garage. Thanks Aunt Betsy.

It would be interesting since the street where I allegedly made an illegal lane change is a single-lane road. But that doesn't seem to matter to the judges who will find you guilty by a preponderance of the evidence.

Funny tho, that wasn't enough when the police chief pulled a shotgun on some unarmed CBers parked on a public street ...

The definition of a crime is a violation of the law. "Damage" is
something which a victim can seek a remedy for. In a local civil case,
a lady successfully sued her neighbor for causing a nuisance with his
illegal CB equipment. There was criminal conduct resulting in damages.

That's a very good point and well taken. But the FCC doesn't respond
to emergency calls. So I think the plan is going to be a little pirate
broadcasting.

What are those contests I hear where everyone and there brother keys up at once calling out there callsigns Knowing full well there are several hundred others trying at the same time. He with the biggest station wins . I call that a keydown. Because if Big strapper station #1 running his 5kw alpha doesnt key up station #2 running a ts-950 at 100 watts into a dipole would be heard. So I call that keying over others. You can try to sugar coat it any other way but it still is a keydown.

I beg to differ, the huge antenna and alternator set-up are a feat of mechanical and electrical works on some that even a Extra Class with Honors WAC, WAS, arrl, BFI, would be envious of. Talking to many of them they have no idea how you can run a amp with 3-500z's in a vehicle and achieve the type of watts that many see. So As illegal as it is, it is so far down on the list of illegal things in life that it is hardly ever enforced and thats what has you so pissed off. Hell more people are fined each year for making a right turn on red, jaywalking, forging others names on NG's to name a few than are busted for "illegal cb activity

I agree with both of you.

Heath/Zenith died because they de-emphasized their bread and
butter (kits), their employees had little knowledge and big attitudes,
and they made large scale decisions that didn't work out (moving
away form kits and into computers and correspondance electronics
education).

You haven't understood my statement i.e. -(but the variable power level control does not operate i.e. full power at min level).i.e. full power at min setting So the power level control vr11/a2 does not turn down the power only the mike gain vr11/b2is doing this .You have read it vice -versa. many thanks for your reply and I invite any further comment please.

regards Adrian

> Don't drive it with more than 4 watts max... You might consider a 12 volt
> fan when you operate it. Dennis mentioned it had thermal problems... not
> really,

Yes REALLY!

The output transistors were bridged directly across the DC power leads ALL THE TIME, even when the amplifier was TURNED OFF!

When the amp got hot enough from normal use, it would also heat the (2) doorknob style Germanium transistors on the tiny little heatsink on it's back panel and their leakage current would increase; heating the back panel even more which further increased their leakage current, etc.,etc.,..... until they reached a point of no return.

Once that amplifier case got hot enough the process would continue in what was called 'avalanche mode' even with the amp TURNED OFF!

Is that a stupid design or what?

The solution was to add a relay to break the path to the converter when the unit was not keyed.

> it should have a fan though as it's not a continous duty amplifier.

It's not even a good ICAS amplifier in it's stock form.

> Also, don't expect a lot out of it or its similar cousin the Sonar BR-21
> type amplifiers. On a good day with a tail wind, hope for about 40 to 60
> watts output.

At least the BR-21's did not self destruct.

The BR-21's switched the DC to the converter when the unit was keyed.

> It's a good amplifier from the folks back in Cedarburg, WI...

That's your opinion.

> If you even want to sell it, keep me in mind.

My advice would be to sell it to Skipp before he takes a closer look at the design.

Regards,

Dennis O.

What are you talking about!For a start agc controls the receive circ not transmitter. The problem I have is that no alc is being applied to the power control section atQ36/Q37 when the powercontol vr11/a2 is turned down i.e. 100w stays from min to max this is the case in any mode.

I doubt it. I have a very old military van that I mounted on the back
of a 2-ton. It used to be a 10kW HF station. It has it's own 15kW
generator (60hp diesel) in the front half, and the old transmitter
rack is sitting happily in the garage collecting dust.

> Talking to many of them they have

>a right turn on red, jaywalking, forging others names on NG's to name a few
>than are busted for "illegal cb activity

True. But I don't think that will be the case in the future. The amps
keep getting bigger and dirtier, there are a lot more of them, and the
operators are getting more careless in their engineering and content
of their transmissions. RF pollution is becoming a bigger issue all
the time, and when these amps can be heard on non-RF equipment, the
pollution they create is becoming more visible to the non-CBer.

The FCC enforces their laws when there is a complaint. They are very
aware of the abuses that occur on and around the CB, and if it
continues, it will only be a matter of time until new laws are
drafted. My concern is that the new laws may include the temporary or
permanent shut-down of the CB.

In other words, a few people are f***ing it up for all of us.

Wanted by nostalgic collector
Midland 7001
On origonal frequencies or converted to 10m band, either is fine.
Prefer good condition, but faulty or rough examples considered.
Must be willing to post overseas as I am located in Australia.
Thanks
Jack

Note. In Australia it is legal to own such a radio. And I do have a license to use 10m band. So the FCC internet police have no jurisdiction in this case.

Still dies , I think it is great that people can amuse themself with a
key-down contest.
They have found a hobby that makes them happy, their research and
development
filters itself into the industrious manufacturers that build radio
equipment. The FCC
allows us to communicate a maximum of 150miles using ground-wave
propagation,
we should concentrate on designing mobile antennas that will take full
advantage of
that range. Has anyone used the Stargun mobile beam that would like to share
their
experience with the group????

Hello Gary: I really dough that you could keep up with me in my daily routine, an easy 9 to 10 hours a day at work, the being a single parent, and working my antennas when I can. You would break a nail and you would be done for the day.

Yes I have a few 40 channel radios, with extra frequencies and such, they make great drivers for the Johnson Viking Ranger II, so that you don't need to mess with the VFO, ya snap the 40 channel to the local channel, I listen a lot.
A pair of 6146's in class B push-pull plate modulating 3 more 6146's is a neat thing to hear your audio in. The Johnson will make a quad set of 3-500Z's bark at the Moon.

Almost as good as the smell of napalm in the morning, with the Rolling Stones in the background, ahhhh the memories.

My only point was that there are a lot of people that do not meet the
8 to 5 criteria, and some do not even need to work. There are many
people that are also retired, disabled, work at home, or their spouse
is the breadwinner. I work for myself, and when I take a break from
the bench I sometimes hop on the computer. That may look like I don't
work to someone that looks at my posting frequency. But that shouldn't
matter.

I respectfully disagree. Most of these hobbyists don't build the RF
equipment they are so proud of. In fact many of them don't know the
difference between resonance, reactance and resistance. Some have no
clue at all how they work, and don't really care just as long as they
'got da power'.

Too many of them have forgotten the 'communication' part of
'telecommunication'. This is evident from a contest where the main
objective involves no communication at all - it's an RF drag-race.
It's not about power, it's about control. You can have all the power
in the solar system, but if there is no control, all that power is
worthless.

To say that this hobby builds engineering skills is like saying "good
job" to the kid who brought a home-built nuclear device to school.
Sure, it may be good work, but somewhat misdirected.

Not even sure I understand, either, but *most* amateur rigs operate
this way where the "level" or "gain" control only controls mike gain
on SSB. It will function as a power control on AM or CW.

If I have stepped in something I shouldn't, please ignore. Don't mean
any harm.

Message-ID: <9a185kcrh1@news.kolumbus.fi>
Source record: 77024

Direct quotes from rec-radio-cb ... Have a guess who the writer might be.

" I've been seriously looking at auction sites for one that isn't uptight about illegal CB equipment."

Comment: they DO admit that what they do is illegal.

" If you trully (sic) are capable of putting up an auction site, and aren't afraid of catering to illegal CB equipment, there's probably some profit to be had. My point is to urge you to persua (sic) (or at least investigate) it. "

Comment: They are clearly stating that they want to get financial profit with their illegal activities. Furthermore, they would very much like to get more people take part in their activities, hence it would be easier to say "I'm not alone, c'mon, don't be square, I'm just another freebander. Go back to your ham ngs" etc.

"The problem (the way I see it) is that Toll (or whoever decides to do this) will have to decide whether they are willing to take what's going to be dished out from all the diffrents angles. Personally, I'm all for auctioning illegal (based on rules --not laws), high-end CB stuff, but am not willing to take the heat that is guaranteed to come down on whoever decides to try it."

Comment: the "masterminds" are chickens who'd like the lesser brethren (hi, hi) to get in trouble with the law and so on, while they are hiding behind the idiots' backs.

Or maybe the license-holder (you guessed right, it was him - again) is slightly afraid of losing his license, although he isn't willing to admit it, for example in this newsgroup. He likes to use his ham knowledge in a terrible way, to ruin and corrupt honest CBers, who only enjoy a nice and perfectly legal hobby. With this I am not referring to the gang &#65533;who regard themselves as high-end CBers - to me, and hopefully to many others, they're plain criminals, nothing else.

Motto: "Thirty billion flies eat shit, they can't be wrong." I use illegal amps and stuff, so why don't you, too?

Our reaction, maybe? To reveal their activities and even help the authorities (the FCC, the police) to get rid of this notorious gang.

Or did I just do this as a "troll" and a "whining hammie"?
We can each draw our own conclusions, dear radio friends.

73 to the good folks here,
doggie-do the illegals

> be done for the day.

I come from a blue-collar family with little income, and I do dare say that I've earned every cent I have with honest and hard work, ever since I got my first summer job more than thirty years ago. I must've broken a few nails myself. And took up that shovel and stated to dig.

>

> 3-500Z's bark at the Moon.

You don't impress me one bit. Most hams can use gear like that, on legal frequencies, of course. I have an extra ticket on the shack wall, but for some funny reason I seldom use more than a few watts, and I always design and build my antennas myself. I even do the welding on the towers.

>
> Almost as good as the smell of napalm in the morning, with the Rolling

Adrian,
On a functioning TS-850 the power control does control the output power in the voice modes. If your's isn't, then the radio has a problem in that circuit. I would suggest you take it to a good Kenwood technician. This isn't what you were looking for, but it's the best advice I can give you.

Build a kilowatt amp from scratch. It must meet the following
criteria:

1) No kits are allowed.
2) All construction must be done by hand, and only by the participant.
3) The design and construction may not copied from an existing amp.
4) It must be built completely from discrete components.
5) No prefabricated assemblies, such as RF transformers, are allowed.
6) It must be capable of radiating no less than 1kW PEP.
7) RF emissions must comply with the regs for 10m ham transmitters.
8) The antenna must be constructed from common materials.
9) All stages of construction must be documented for verification.
10) The working amp must be verified by a non-interested third party.

Any takers? If there are, I might consider putting up some sort of
prize.

Sparky, FLCD

If your gonna make the rules for some one else's amp, I'd want some up-front money before starting. $$$$$$ thaaaaats riiiiight!

> 1) No kits are allowed.

I know there is a guy back east that sells 4 and 8 pill mobile amp kits, but that's all I know about. This shouldn't be to hard to avoid.

> 2) All construction must be done by hand, and only by the participant.

No problem

> 3) The design and construction may not copied from an existing amp.

Now who is going to be the judge on this one, most all the manufactured amps are in many ways copies of each other, in design, and in internal purchased parts.

> 4) It must be built completely from discrete components.

No problem

> 5) No prefabricated assemblies, such as RF transformers, are allowed.

No problem

> 6) It must be capable of radiating no less than 1kW PEP.

This will need to reworded to "be able to have a output power of 1KW PEP"

> 7) RF emissions must comply with the regs for 10m ham transmitters.

Why ham transmitters, why not ham amplifiers?

> 8) The antenna must be constructed from common materials.

Whats not common?

> 9) All stages of construction must be documented for verification.

Most people have a camera, but no ones going to do it. I'll buy the film after recite of the 1000 dollars.

> 10) The working amp must be verified by a non-interested third party.

Yeah who? And for how much? Need a list of what there going to be looking at.

> Any takers? If there are, I might consider putting up some sort of
> prize.
>
> Sparky, FLCD

What I have always wanted to build is a amp with a pair of 4CX250's, 350's, 400's or even 800's in class B push-pull so that a stock radio, or even a 100 watt radio would drive it to over 1000 watts, with a nice clean signal.
The input circuit could be switched from different taps on a transformer for the different input power levels.

I want a Bird watt meter cavity installed in the amp with a modified Peak Reading option, and a great looking meter, mounted on the front panel.

You can get things going real fast, just send me a cool 1000 dollars to start with, I'll take it from there.

Jay in the Mojave

No kidding. I don't think there is a serious freebander or amplifier jockey that doesn't know that what they're doing is illegal. The problem is that they don't CARE. They justify what they're doing in many different ways, in some vein attempt to smooth their own conscience in the process. "Yea, I'm breaking the rules, but it's not like I'm killing somebody". The problem with this type of thinking is that once you've become accostomed to ignoring laws, it becomes easier to ignore or justify breaking more and more of them. This kind of thinking is what's slowly destroying our society.

An observation: I sounds like the "work" of the people such as Voobner,
is slowly having an effect on those that profit from illegal activities.
As much as they berate those of us that try to stick by the rules, they
are conscious of the fact that the increased visibility puts them at
risk, and they are a bit less cavalier about their activities.

Pesonally, I don't care that small pockets of people talk on "freeband"
channels, or run pumped up stations. It's when the problem becomes so
widespread that it starts to affect the proper use of the CB service,
and leaks into other legitimate radio services as well (10 meters). At
that point, the brakes need to be applied. I never thought that I'd be
in favor of the activities of "Uncle Charlie", but maybe some people
need to be made examples of, so that the rest of us drop it back a few
notches.

Hello all,

I am looking for a expo 100 expander model N.

Can anybody give me a web site where I can buy one? - or anybody want to sell me one?

Is the expo kit the best/only way to expand a uniden pro640e? oh I have a Pearce-Simpson Super Cheetah too - both use the upd2824c pll.

Thanks

Peter.

No kidding. I don't think there is a serious freebander or amplifier jockey that doesn't know that what they're doing is illegal. The problem is that they don't CARE. They justify what they're doing in many different ways, in some vein attempt to smooth their own conscience in the process. "Yea, I'm breaking the rules, but it's not like I'm killing somebody". The problem with this type of thinking is that once you've become accostomed
"(sic)"
to ignoring laws, it becomes easier to ignore or justify breaking more and more of them. This kind of thinking is what's slowly destroying our society.

"I hesitated replying to this post, because it is obvious our Finnish acquaintance has stripped himself of all dignity and what little credibility he had left by taking off all his clothes and rolling in the fecal matter with the other delusioned short bus scholar and has sunk to same trollish level. Kari is only a porn pic away from being permanently relegated to the trash heap that he frolics in so freely and happily. BUT, sandbaggin' Dave, I don't think you can equate being "accustomed" to breaking laws and say it is easier to disregard other laws because of it. Hogwash. Have you ever went over the speed limit? That affects other lives as well, no? It does not aptly apply to the situation at hand, anyway. Destroying the very fabric of society are folks throwing stones and not taking responsibility for their actions...always looking to point blame."

" If you trully (sic) are capable of putting up an auction site, and aren't afraid of catering to illegal CB equipment, there's probably some profit to be had. My point is to urge you to persua (sic) (or at least investigate) it. "
Comment: They are clearly stating that they want to get financial profit with their illegal activities. Furthermore, they would very much like to get more people take part in their activities, hence it would be easier to say "I'm not alone, c'mon, don't be square, I'm just another freebander. Go back to your ham ngs" etc.
Again, no kidding. There is a lot of profit to be made from gullible CBers,

"And one hell of a lot of goose chases to send the self-appointed hammie cops on."

that are easily impressed with gadgetry, and the allure of big power is a boost to the ego's of the socially inept,

"Does that go for advancing your ticket as well? The higher ticket you hold. the more inept at social skills? Ridiculous. Did this theory

materialize after eating the same European beef that Kari has been
cooking on the grill?"

and otherwise underachievers in society.
I do tech work on all sorts of 2 way radios.

"Here we go. The self elevation. What was that about an ego boost? Is
this now a three member black kettle club, or are you just pledging?"

By far, the most work that I used to get is from CBers that want "mods".
Some mods I would do. But I am against anything that makes a rig
"dirty".

"Good for you."

I prefer to just fix the crap that other techs make.
So there is money to be made from people that aren't shy about opening
their wallet for the next "gee whiz" CB toy.

"Toys and power are separate issues."

"The problem (the way I see it) is that Toll (or whoever decides to do
this) will have to decide whether they are willing to take what's going
to be dished out from all the diffrents
"(sic)"
angles.

"Already being done. This will just be another avenue. Don't bother
asking 'cause those that need to know, already do."

Personally, I'm all for auctioning illegal (based on rules --not laws),
high-end CB stuff, but am not willing to take the heat that is
guaranteed to come down on whoever decides to try it."
Comment: the "masterminds" are chickens who'd like the lesser brethren
(hi,
hi) to get in trouble with the law

"The law you RF cops refer to has no jurisdiction when you have an
export business in the Bahamas importing ten meter radios to the states.
In addition, it's tax free. Thing is, when stuff gets tough, the tough
tend to get creative. I know of one business that thanks your kind, no
more taxes. Put that in your pipe and smoke it."

and so on, while they are hiding behind the idiots' backs.

"Hides? Oh, you mean like anonymous posts."

Or maybe the license-holder (you guessed right, it was him - again) is
slightly afraid of losing his license, although he isn't willing to
admit it, for example in this newsgroup. He likes to use his ham
knowledge in a terrible way, to ruin and corrupt honest CBers,
who only enjoy a nice and perfectly legal hobby.

"You honestly could not possibly believe that."

With this I am not referring to the gang ´who regard themselves as high-end CBers - to me, and hopefully to many others, they're plain criminals, nothing else.

"Go stand over there where the other two stand when they feel the need to defecate."

An observation: I sounds like the "work" of the people such as Voobner, is slowly having an effect on those that profit from illegal activities.

"Sure did. As I said, one business I know is now tax free."

As much as they berate those of us that try to stick by the rules,

"Here is where you are quite arrogant and dead wrong. No one berates anyone for abiding by the rules. On the contrary, something appears to happen to the loins of the two girls (you too?) whenever something is discussed they do not like. You would like to turn this around, but I won't let that happen."

they are conscious of the fact that the increased visibility puts them at risk, and they are a bit less cavalier about their activities. Pesonally, I don't care that small pockets of people talk on "freeband" channels, or run pumped up stations.

"Wrong. You do care. And it is personal. You referred to them as criminals and you used the words, "to me"...as in , "to you"..which means..taaaa daaa.....PERSONAL! You aren't too sure of yourself, are you?"

It's when the problem becomes so widespread that it starts to affect the proper use of the CB service, and leaks into other legitimate radio services as well (10 meters). At that point, the brakes need to be applied. I never thought that I'd be in favor of the activities of "Uncle Charlie", but maybe some people need to be made examples of, so that the rest of us drop it back a few notches.
Dave

"You won't find a single post by me advocating globs of power, but I still get lumped in with them. Do I care? Not in the least. I sure love talking about it though. As I said, it does something to hermie and Kari, sort of acts like a rope, no, a.., a string, yea..that's the ticket. Anyone can grab my string, but I must warn you, it has a residue like fly paper, and takes away your free will."

Depends on the prize.....

I suggest you also put a dollar limit on the amount that can be spent to build the amp, like $500.00 or less.

That would make it a little more of a challenge to build one that would be able to meet or exceed the FCC specs.

You stated that it must be capable of RADIATING 1KW PEP, well if you specify an ERP of 1000W PEP you have to specify the antenna type and number of elements that everyone must use, and you must also specify the method you would be using when measuring the field intensity, and at what distance from the antenna feedpoint that measurement would be taken.

If I built a 1KW amp that only radiated 1KW PEP, I would need a really poor antenna system to do that, like the proverbial 'isotropic source', or at best a simple dipole made out of Nichrome wire.

A few more questions about that 'KILOWATT' you refer to: is that input power or output power, RMS or PEAK?, and what would be your method of measuring that power?

The VERIFICATION can be done at a local Metrology lab. which is certified to do that type of thing.

It was a grounded grid sweep tube based amp..

The problems were mainly with the power supply, not the amp itself; although
the amp also left a lot to be desired.

ALLY!
>
> The output transistors were bridged directly

The above text should read 'DC to DC converter output transistors', or just 'DC to DC converter transistors'.

This amplifier had a grounded-grid SWEEP TUBE TYPE RF amplifier stage, and the transistors were just for converting low voltage DC (12V) to high voltage DC (800V to 1000V) for the tube plate circuits.

I posted this clarification so folks would not get the wrong idea and think the large transistors on the back of the unit were RF output transistors; because they are NOT.

: Dennis W. Ostrowski <dwostrowski@lucent.com> wrote:
:> Don't drive it with more than 4 watts max... You might consider a 12 volt
:> fan when you operate it. Dennis mentioned it had thermal problems... not
:> really,

: Yes REALLY!
: The output transistors were bridged directly across the DC power leads ALL THE
: TIME, even when the amplifier was TURNED OFF!

Hi Dennis,

Time to debate the design..? There's nothing wrong with the transistors
connected to the Vcc supply all the time. It's fused and a very common
practice. The term bridged is not really accurate or proper. The
amplifier contains a straight forward dc to ac inverter circuit.

: When the amp got hot enough from normal use, it would also heat the (2)
: doorknob style Germanium transistors on the tiny little heatsink on it's back
: panel and their leakage current would increase; heating the back panel even more
: which further increased their leakage current, etc.,etc.,..... until they
: reached a point of no return.

As I mentioned, the Kris 300m is not a continous duty amplifier. Normal
use would not provide enough heat to cause a thermal runaway. The owners
manual (of which I have a copy of...) clearly mentions to place and
operate the amplifier in a well ventlated location.

The power transistors on the rear pannel are not door knob style. Most
all basic text books describe transistor runnaway, when this amplifier is
operated correctly (as described in the factory paperwork, it should be
just fine. Your follow up reads like you didn't handle the amplifiers
duty cycle well enough and one you had went poof... check the paperwork
and I think you'll see the power inverter oscillator is off in the standby
position. The transistors are off in the standby/receive mode...

: Once that amplifier case got hot enough the process would continue in
: what was called 'avalanche mode' even with the amp TURNED OFF!

First off, it's not called avalanche mode... so we know your blowing smoke
there. How about thermal runnaway as the proper description. If a
runnaway problem did occur (and these types of amplifiers do fail, like
everything that may be abused), the fuse (did you have a fuse in line
Dennis..?) would blow. Fuses are a wonderful thing for people who can't
read the paperwork...

: Is that a stupid design or what?

I like the "or what" part myself... Since you don't sound like you have much of a classic inverter education, let me help you out a bit. The design is very common for the period it was used and often found in many other places like regular DC to AC 117 volt power inverters. It was not uncommon to see transistor leads tied to the Vcc supply line through a fuse, indeed... it's often practiced in designs made today. Large current relays cost real money, why install one when it's not required in a good design.

Tripplite has similar designs in many of their line of dc to ac inverters.

: The solution was to add a relay to break the path to the converter when the
: unit was not keyed.

It's not a required solution... it's an after the fact mod you came up with because you don't know what your doing here...

:> it should have a fan though as it's not a continous duty amplifier.

Although not required, I do agree that it would be helpfull to have a fun sucking air out of the tube vent holes. Cheap inssurance for additional tube life.

: It's not even a good ICAS amplifier in it's stock form.

Wow..! you throw out the icas term. Your good with the buzz word terms... for what it is and what it was designed for, it's a great little amplifier. Your bad experience with one shouldn't taint the opinions of others who operate them without any grief. What do you throw out as a good icas amplifier, made that period of time in a similar price / clase range..?

:> Also, don't expect a lot out of it or its similar cousin the Sonar BR-21
:> type amplifiers. On a good day with a tail wind, hope for about 40 to 60
:> watts output.

: At least the BR-21's did not self destruct.

Self destruct is a bad term... you should avoid throwing it out so freely.

I have two Sonars in for repair right now, I've reversed engineered the circuit and the Kris is a very similar design. Almost all the problems I've ever repaired with these type of classic designs have been operator caused. The BR-21 on my bench right now has failed transistors and more...

: The BR-21's switched the DC to the converter when the unit was keyed.

No it does not..! it turns the inverter oscillator on when the tr relay is keyed. See, now I know your a blow hard without much real knowledge and experience. Your just plain wrong... Both the Kris and the Sonar have constant DC supplied to the inverter transistors. The inverter oscillator section is keyed on and off through a t/r relay.

:> It's a good amplifier from the folks back in Cedarburg, WI...

: That's your opinion.

It's a much more qualified opinion than yours appears to be...

:> If you even want to sell it, keep me in mind.

: My advice would be to sell it to Skipp before he takes a closer look at the
: design.
: Regards,
: Dennis O.

When you have some facts, a lot more background, more education and a
little less ego... feel free to chime in with your then more informed and
hopefully qualified opinions. Right now your not doing so well...

2583. swr problem - HELP!

Newsgroup: rec.radio.cb
Date: 2001-03-30 18:44:46 UTC
From: Mike Bleiweiss <mbleiweiss@laurelholdings.com>
Message-ID: <tc9l3r2qvst72@corp.supernews.com>
Source record: 77057

This is driving me NUTS!! No matter what I do, I keep getting an SWR of 3.2. I have a 4' fiberglass antenna in the attic near a window, with 25' of 52-ohm coax running downstairs to the back of my unit. I've checked all of my connections. The antenna is grounded to a sewer pipe running through the attic - and its one of those with the adjuster screw in the tip of the antenna. No matter how much I adjust the thing, I keep getting 3.2. Any ideas?
Could a bad ground cause this? Is it because it's inside the attic instead of outside my house? Do I have a faulty radio?

Any help would be appreciated.

Just a thought, Mike. That sewer pipe is NOT ground. Sure, it's DC ground, but how far back do you have to travel until it is actually buried in ground, or even before it branches to other sewer pipes? 20 feet? What is a quarter wavelength on 11 meters? Ummmm ... 9 feet? Your ground system is likely radiating and is part of the whole antenna system, throwing the works out of tune. You also likely have rf radiating from the coax. You'll likely have to go to an antenna not requiring a ground or some kind of counterpoise system. I know artifical grounds are sold (which tune out reactance from a long ground, sort of like an antenna tuner), but have never used one and don't know if they would help a lot; however, you would still be radiating from that long 'ground' wire. I'm sure there are some folks in this group that could recommend a good 'groundless' antenna.

So in theory I should just stick the antenna outside on top of a pole, grounded right into the dirt in my back yard, right? Then it shouldn't really matter how long my antenna cable is (shouldn't be more than 50 feet) - and I should get a better SWR. I've noticed that when I "un-ground" my antenna from the sewer pipe, I get the same exact SWR reading. Does that give you any more ideas?

Yup, it just says that the sewer pipe is not a good ground plane.

An antenna has to be half-wave in total to work. Your fiberglass antenna is a 1/4 wave which depends on the car body to be the other half. So you need to come up with the other half; it is this, not that it is 'ground' that will make it work. Lots of antennas work without either a DC or rf ground.

What sort of mounting do you have? If you are going to do this, you need some 'radials', three or four 9-foot wires run at right angles to establish a non-directional 'ground plane' and it is nice to be able to solder them to the mount where they will connect to the braid. If you have a magnet mount, solder the radials to nails and let them make the connection.

Because you are loading a lot of roofing nails, attic installations are a bitch to make work. Good Luck

Well, that coax has a shield, and RF is likely traveling back down it to the radio. I did have a similar situation before I went off to Vietnam. I end fed a wire antenna several hundred feet in length from a 2nd story bedroom. I used a radiator (for hot water heat in the bedroom) as PART of the ground system. I then ran a few wires down to 5 or 6 six foot pipes I hammered into the ground. The feeds were different lengths, just to ensure that at least one of them could supply a reasonable ground. It worked just fine and I ran the thing on everything from 1.8 MHz (160 meters), on up through 21 MHz (15 meters). 65 watts gave me consistant 50 miles during the daytime on 160 (I yakked with Buffalo at least a couple of times a week, and Washington DC broke in once but was so weak he had to switch to CW and the guys in Buffalo had to relay to me. I was banging into Washington DC from Rochester, NY around 1:00PM on 160 meters!). Worked a lot of Europe on 15. In short, I had a ball. The problem is getting a good ground at a distance. The attic won't matter at these frequencies (you won't get television satellite reception through the walls, but on HF the walls are transparent). I'd try for a good ground first if it isn't too difficult; otherwise opt for a dipole or groundless vertical. I can't prove it, but suspect the SWR is cause by more than the antenna (ie; lack of good ground).

I just went out and bought 10' of galvanized steel 1/2 pipe. I'm going to bury 2 feet of it and mount the antenna on the top, outside in my backyard. I got 3 1' pipes, and I'm going to stake those in around the mast and run guy wires to it. That should work pretty good, right?

Mike

2590. Re: STILL having problems

Newsgroup: rec.radio.cb
Date: 2001-03-30 20:48:04 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <3AC4F104.A9545125@qnet.com>
Source record: 77078

Hello Mike: I know the frustration your going thru, and the wanting to throw the antenna in front of a fast moving cement truck, and have 16 to 17 beers, and then consume mass quantities, yeah!

When I see a constant bad SWR (no matter how many bullet holes I shoot in the antenna) I start to suspect the coax. Most antenna problems I have seen mobile and base, are poorly soldered or not soldered shield connection in the PL-259 connectors.

Check the coax with a VOM Meter, I start with measuring the resistance on the R times X1 scale. With the meter on the RX1 setting, hold both leads in your hands, (you won't get a shock) if the meter reads some value the meter is shoot for resistance measurements, but can still be used for coax testing. But shouldn't read anything. Now touch the two meter leads together and you should be able to see a reading, adjust the OHMS Adjust for Zero or the right hand scale ending. Or as close as you can.

Connect the meter leads to each end of the coax center pins of the PL-259 connectors, you should be able to see about 1 Ohm of resistance, wiggle one end at a time to see if you can identify one the one ends of coax having a intermittent connection. Now do the same for the shield connections. Now measure between the center pin and the shield connection, you shouldn't read any resistance between the center and shield connections. Wiggle each end also for testing the shield to center pin resistance.

If all is well, maybe something else.

But if the coax measures bad, you probably need to resoled the PL-259 connectors on the coax. If you haven't done this before or aren't a Nasa Certified solder'er type ah guy, have the local CB Shop solder them on for you, and ask them to check your coax.

If you have a dummy load (acts as a perfect antenna, Radio Shack has them for 22 dollars I think, and you will need a double Female SO-239 adapter, also at Radio Shack) and put the dummy load in place of the antenna, and the SWR is now 1 : 1, this will verify the coax is working and the antenna is bad. If the match is still a galzillion to one, then the coax is bad.

Let me know how you make out. Fell free to e-mail me. Them high speed electrons work just fine out here in the Great Mojave Desert.

Jay in the Mojave

From: Mike Bleiweiss <g@g.com>
Message-ID: <tca273sokfsp24@corp.supernews.com>
Source record: 77065

Okay, I put in a 10 foot mast of 1/2" galvanized steel pipe, with the antenna assembly mounted on the top. The mast is driven 2 feet into the ground (so 8 feet of it is exposed). The antenna is one of those 4' fiberglass whips with the coil running around it and then tightly wound at the top, then insulated in plastic (a firestik?). I drove 3 - 2 foot stakes made of 1/2 galvanized steel pipe into the ground at 3 points around the mast 8 feet apart. I ran steel guy wires from the mast to each of the stakes. The guy wires are soldered to the mast and to the stakes.
There is 50' of 52-ohm coax cable running from the antenna, wrapped 4 turns around the mast, then directly to the back of the receiver. The receiver is brand new (replaced the other one from this afternoon just to make sure it wasnt the receiver). The SWR meter is correctly calibrated. The length of 50 feet of cable runs into the SWR meter, then a 4' 52-ohm cable is run from the SWR meter to the receiver.
NO MATTER WHAT I DO I STILL GET AN SWR OF 3.2. The meter goes to 4, so the needle isn't completely "pegged", it just reads 3.2. I can spend all day adjusting the screw in the antenna for the proper length, and the SWR meter doesn't budge.
Does anyone have any idea of whats going on??!?!? I'm totally frustrated.

Thanks for your help.

Mike

Mike, just remember that burying 2 feet of that pipe will leave 8 feet sticking up in the air - nearly 1/4 wavelength! If you are depending upon that for a ground, you may well be in for a bit of trouble. Now, if you insulate the antenna from that support and use the support wires as a ground (ALSO insulated from the pipes you will be holding them with), you may be able to use those other 3 wires as a groundplane. In fact, you SHOULD be able to use them as a groundplane. They will have to be a bit over 1/4 wavelength in length (this will occure naturally since the antenna will be 8 feet high and the guy wire anchors will have to be moved away from the pipe supporting the antenna. You may have to play with the lengths of them a bit (using insulators to avoid connecting them to the other steel pipes you will be anchoring them with), but you should achieve a decent SWR and a decent signal to boot! When you achieve the low SWR and good signal, let us know which is more fun - antennas or computers! Enjoy!

73 from Rochester, NY
Jim

Let's make this a contest.

1) Entrants may not hold, or have previously held, a ham license.
2) No kits are allowed.
3) The circuit must be designed by the entrant.
4) All construction must be done by the entrant.
5) It must be built completely from discrete components.
6) No prefabricated assemblies, such as RF transformers, are allowed.
7) Output power must be no less than 1kW PEP.
8) RF emissions must comply with 97.307(a),(b),(c), and (d).
9) All stages of construction must be documented for verification.
10) The completed, working amp must be delivered, with documentation, to a non-interested third party, a judge, for verification.
11) The amps will be judged upon quality of construction, sound electronic engineering, operational performance, and any other criteria that the judge deems appropriate.

All rules subject to revision for the purposes of fairness, clarification, and closing loopholes.

Sorry Jay, no contest is ever going to front you any money. But you get to keep your amp, if that's any consolation. Or, find a sponsor that will take the amp, win or lose.

A judge would have to be found before the contest would begin. Personally, I think Dick would be a great choice, if he's game.

As long as the leakage currents can be kept under control.

With Germanium power transistors in a place where they can get extremely hot,
it is not a good practice.

> It's fused and a very common
> practice.

With silicon parts, not with germanium.

> The term bridged is not really accurate or proper.

I did not say the circuit was a bridge circuit.

I said the power transistors were bridged across the DC supply.

If I were to touch the negative terminal of the battery with my thumb and the
positive terminal with my index finger I would be bridging those terminals with
my hand would I not?

> The
> amplifier contains a straight forward dc to ac inverter circuit.

It is a DC to DC converter circuit because the AC is not an output, the DC
is....

> operate the amplifier in a well ventlated location.

That may be true, but back when I was repairing them, it was the amplifier that was most likely to fail under operating conditions where other amplifiers survived.

> The power transistors on the rear pannel are not door knob style.

That may be true, it's been a long time since I worked on one.

They may have been TO-3 cased parts, but they were Germanium as the semiconductor material, and that was the problem.

> Most
> all basic text books describe transistor runnaway, when this amplifier is
> operated correctly (as described in the factory paperwork, it should be
> just fine. Your follow up reads like you didn't handle the amplifiers
> duty cycle well enough and one you had went poof...

I never owned one myself, but I feel sorry for those who did.

> check the paperwork
> and I think you'll see the power inverter oscillator is off in the standby
> position. The transistors are off in the standby/receive mode...

They shut down the oscillator by playing with the feedback path instead of breaking the DC path for collector current.

Therefore the leakage current path continued to exist at all times, and if the transistors had a high enough current gain the oscillator actually continued to oscillate at a low level.

The Plate voltage would drop to about 60 VDC because any voltage higher than that caused enough plate conduction to load down the oscillator enough to keep the voltage from rising any higher.

They didn't all do that, but a lot of them did.

You could put a scope on the transformer leads and actually see that low level oscillation.

> : Once that amplifier case got hot enough the process would continue in
> : what was called 'avalanche mode' even with the amp TURNED OFF!
>
> First off, it's not called avalanche mode...

You are right. Thermal runaway is a more correct description.

Avalanche mode more precisely refers to how an SCR works, with it's reinforcing feedback.

I saw the process as: increased leakage causing increased heat, causing increased leakage, causing increased heat, loop as a similar type of reinforcing feedback.

> so we know your blowing smoke
> there.

All we know is that I did not pick the most descriptive term to describe what was happening.

> How about thermal runnaway as the proper description.

I agree that is a more 'proper' description for what was happening than the one I used.

> If a
> runnaway problem did occur (and these types of amplifiers do fail, like
> everything that may be abused), the fuse (did you have a fuse in line
> Dennis..?) would blow.

Once again, I have never used one of those amps, but made lots of money repairing them, thank you.

I believe the amplifiers were fused and that the fuse blew right after the transistors melted down and turned from semiconductors into excellent conductors.

I believe the inline fuse for that amp was at least a 20 ampere unit.

With a battery voltage of 13.8VDC and with 20 amperes of current (the holding current of the fuse) the power dissipated in the transistors could be as high as 276 watts from leakage current WITHOUT blowing the fuse.

The transistors did not have that high of a dissipation rating at 25 degrees C, much less at 100 degrees C.

At the elevated temperatures they ran at (just because of the fact that the amplifier was a tube amplifier with filaments that were on all the time even if the amp was never keyed {or a ZERO percent duty cycle}), I would expect their dissipation ratings to have been reduced to some extent.

So it WAS possible for the transistors to exceed their power dissipation ratings without blowing the fuse if their leakage currents were high enough.

> Fuses are a wonderful thing for people who can't
> read the paperwork...

I agree.

> : Is that a stupid design or what?
>
> I like the "or what" part myself... Since you don't sound like you have
> much of a classic inverter education, let me help you out a bit.

Thank you.

> The design is very common for the period it was used and often found in many
> other places like regular DC to AC 117 volt power inverters.

The 'generic' design was very common, but that particular design was just not as thermally stable as the others were.

It is very common for cars to be designed using 4 wheels, but there is a big difference between a Corvette and a Chevette.

> It was not
> uncommon to see transistor leads tied to the Vcc supply line through a
> fuse, indeed... it's often practiced in designs made today.

That is true, but those designs did not have the thermal runaway ('proper' term
used this time?) problem that Kris 300 did.

> Large current relays cost real money, why install one when it's not required in a good
design.

THIS I AGREE WITH.

But if I remember correctly, the antenna switching relay they used in that amp
had 15 or 20 amp contacts on it.

> Tripplite has similar designs in many of their line of dc to ac
> inverters.

I would not know because I have never repaired a Tripp Lite DC to AC inverter.

(I have repaired some of their high current power supplies and was not really
impressed.)

Hopefully they have much more heatsink area per watt of delivered output than
the Kris had.

> : The solution was to add a relay to break the path to the converter when the
> : unit was not keyed.
>
> It's not a required solution... it's an after the fact mod you came up
> with because you don't know what your doing here...

What was the better solution?

With the relay solution, the customer could put the same amp back into the same
place in his mobile and run it exactly the same way he did before and never have
it 'melt down' again.

> : It's not even a good ICAS amplifier in it's stock form.

How about MELT DOWN?

> I have two Sonars in for repair right now, I've reversed engineered the
> circuit and the Kris is a very similar design. Almost all the problems
> I've ever repaired with these type of classic designs have been operator
> caused. The BR-21 on my bench right now has failed transistors and
> more...

Why bother?

The Germanium power transistors for the DC to DC converter plus the high price of replacement tubes would cost much more than some of the new solid state RF amplifier transistors, (like the 2SC2879's) and a pair of them will put out a lot more power with more efficiency than that old tube amp ever will.

> : The BR-21's switched the DC to the converter when the unit was keyed.
>
> No it does not..! it turns the inverter oscillator on when the tr relay is
> keyed. See, now I know your a blow hard without much real knowledge and

Check your connectors and coax, make sure none of the coax is pinched anywhere. Meters can be bad also, not saying that is the case here, but I definitely would not rule it out. Can you hook another radio up to see what the swr is, and if it changes? The antenna could be tweaked also.

Mike, see my previous reply to your earlier post. If the post your antenna is fastened to is connected to the coax braid, you have almost 1/4 wave of pipe which is being held at ground at the far end - this puts it at a high RF point at the coax. The other guys, if also connected to ground AND if connected to the other pipes are doing the same thing - and you, in effect, have NO ground. Insulate the antenna from the mast, use the 3 support wires as a counterpoise (which means insulate them from the main pipe and the support pipes). This should get you some kind of RF ground. You are having a similar problem to what you had in the attic - ie; an excessively long ground which is, in effect, NOT an RF ground. You may elevate the antenna (which you have done), but understand that grounds are harder to come by (actually, you don't need a 'real' ground - our satellites do quite nicely without them). What you need is a place for the RF to go when feeding the antenna. A gound plane uses those dangling radials as such a place to put the RF. You could use the supporting wires in the same manner - BUT they have to be isolated from ground at the far end since that would place the feed point at high potential (read 'isolated from ground').

(Sigh) And I thought this had been settled already. Dwight, The rules
you quote and cite are designed to prevent a CB from being modified and
used within the CB band after said modification. NOTHING in those rules
prevent a licensed ham from converting a CB over to the 10 meter ham
band SO LONG AS IT NO LONGER operates on 11 meters! Once the radio has
been removed from the service for which it was originally intended, it
NO LONGER falls under the rules that govern the former use. It now is
governed by the rules pertaining to the service that the radio has been
modified for! All you have to do is to email Riley Hollingsworth, he
WILL answer you, and he will tell you the same thing the other hams have
been telling you all along, and that VHFRadioBuff has already conceeded.
It is so simple, why can't you accept the truth so we can end this
thread and take on something else! BTW, Dwight, what about all those
police Motorolas we have modified over the years for 6 and 2 meters?
I used to have two old tube type Twin Vs on 2 meters and they came out
of police service!

Dwight,

What you are refusing to see is that the rules intend that NO CB trans-
ceiver will be modified to add power, change modulation parameters, or
add "channels" while being operated under the quoted rules. A ham who
does modify a CB rig for 10 meters must do so in a manner that PRE-
CLUDES said transmitter from continuing to operate on 11 meters. IOW,
It CANNOT operate in BOTH bands! Once that radio is completely changed
over to 10 meters IT NO LONGER OPERATES UNDER PART 95! It is now a
HAM radio!! It CANNOT operate on 11 meters. THEREFORE! It is no longer
a CB, the requirements for a "certified" technician no longer apply! As
a ham, I CAN make adjustments and repairs to my OWN equipment--which I
do. I CANNOT take in a CB, repair it for a "customer", return it to
operation on 11 meters and charge him for said repair.

You ARE correct that a ham cannot repair or modify a CB rig. But that
only applies to equipment that operates under Part 95. Go find
something that says I can't repair or modify a HAM rig.

Respectfully,

Jerry

boomer 400 covers 2 - 30 meg,s and will do 400 watts with a good tuned radio .
radio watts are 2 watt dead key and 14 rms watts .

The antenna you mention sounds like a top-loaded 5/8wave, wrapping the coax
4 turns around the
pipe could be acting as a RF choke, this could produce a high SWR. Try
running the coax
straight down the mast and taping it at selected locations.
I noticed you have no (apparent ground plane), insulate the guy wires with
wood,plastic or
ceramic insulators where they attach to the ground. This will effectively
create a ground plane for
the antenna while still acting as support for the mast.
Hope this helps.
P.S. How are you going to tune the antenna? Top-loaded antennas usually
require a small amount
of wire removed from the top of the coil, if the antenna is electrically
short you can grab about
3 coils and pull them up a 1/4". That effectively lengthens the
antenna.......

Last time i checked "PEP" means "Peak Envelope Power", and is measured at
the output of the
source. I am also confused with the antenna issue due to the fact that "ERP"
is measured in the
near-field of radiation. A couple pairs of co-phased cubical quads would
create intensely
high gain figures with relatively low input (way less than 1Kw).

I respectfully disagree. Most of these hobbyists don't build the RF equipment they are so proud of. In fact many of them don't know the difference between resonance, reactance and resistance. Some have no clue at all how they work, and don't really care just as long as they 'got da power'.

Too many of them have forgotten the 'communication' part of 'telecommunication'. This is evident from a contest where the main objective involves no communication at all - it's an RF drag-race. It's not about power, it's about control. You can have all the power in the solar system, but if there is no control, all that power is worthless.

To say that this hobby builds engineering skills is like saying "good job" to the kid who brought a home-built nuclear device to school. Sure, it may be good work, but somewhat misdirected.

hehe, but that assumes anybody is capable of actually building one. If
it conforms to the rules, it does not necessarily have to be illegal.
But it's probably safe to assume that none will ever be certificated
(or even built, for that matter).

Damn, and here I was ready to scrounge some old microwave transformers and diodes to build the 2kv supply and supply the blowers, see if motorola had some 4CX250 pulls, and make reservations for the Sioux City hamfest to scrounge the rest. Going for the el cheapo trophy.

You have a point, I am allowed one a year of any given design. This group couldn't agree on lunch time let alone amp design.

Add one more rule for the judge. All power readings will be taken AFTER a good B&W lo-pass filter with a two-tone SSB test and must yield something resembling the classic trapezoid. Then and only then will we sweat tech specs.

Dick

Our 25/85 repeater in St. Louis came directly from an Illinois sheriff's office. Some Motorola people helped us get the parts to mod it -- directly from GE. The autopatch came from a non-Amateur who was Motorola's tech rep. To think we might all have gone to jail :-)

You need to insulate your antenna from the mast, like one previous post suggested.
You have too many wires connected to your mast and your other pipes. If you only have the antenna up that high, I don't know why you'd really need guy wires anyway.
Simplify everything by trying it with just the antenna mounted/insulated from the mast, no guys or other pipes in the ground. THEN see what happens.

Do that first, and if you still have problems, THEN you can grab a VOM and do all the tech stuff that some others have suggested. I don't think your problem is nearly that desperate yet! :-)

Since adjusting your ground and antenna will almost (key word
'almost') always change your SWR to some extent, the fact that it
didn't move at all when the antenna and ground were changed would seem
indicate a problem before it gets to the antenna. You replaced the
coax and the radio and the SWR still hasn't budged. Did you check the
antenna mount?

If your radio, coax, antenna and mount all check good, the only
alternative is your SWR meter.

Message-ID: <3AC58B14.1A5E3474@home.com>
Source record: 76913

NOTE! Please email me first to be sure I have antennas still available.
I can also provide a 10 ft. jumper with BNC connectors at each end for
$6.00 extra for a total of $61.00. Thanks!

a reference from one of my customers!!
(Thanks Robert, I received the antenna, it was as I expected and works
great with my Garmin GPS-III+. Don't hesitate to use me as a reference.
73 de AC7KE)

I have for sale, once again, a bunch of these real neat GPS antennas. I
had 12 units that sold out in a few weeks last year. Please check
out the 3 pictures for full information. Some have red gaskets, some
have white and some have black gaskets. This gasket seals the antenna
when you drill the hole for securing it. No difference but in case you
purchase one the color of the gasket might vary plus when they are
installed you don't see it anyway. They all have white tops. 2.75 inch
wide X .75 inch thick. Antenna requires 5 volts DC and receives its
power form the GPS unit like the Garmin GPS-1, GPSII+, GPS III plus etc.
units that provide power up
to the antenna. $55.00 includes FREE USPS Priority mail shipping in the
USA only. Payment via PayPal or USPS Money Order or Western Union money
orders.
Money orders and will ship in a few days, if you do send a personal
checks I will ship when it clears
the bank. All units have been tested and are working. Have about half a
dozen to dispose of. If interested, send me an email! Thanks for your
interest!

I never considered it an issue. The unmoderated newsgroups don't
require standing to post. In fact, there is nothing that says a poster
must be a CBer, not even in the FAQ, only a request that the
discussion stays on topic. Which it does for the most part.

Hey, how close are you to the border with Norway? I was up there with
the USMC in 1984 and loved it! Even made some CB contacts with the
MRC-110.

What gave you a case of the aggravated surlies on a California morning and a Friday at that??
Couldn't get a date this weekend? Get the suppositories in sideways? Why the need to establish yourself as King Kong?

In the instant case:

1. Eimac tetrodes are rarely run in Class B for any number of good reasons of which drive power ranks well down the list. The biggest one that comes to mind is that they are not all that linear in the cut-off region.

2. While a transformer is not my idea of how to do it, matching a load that is popping in and out of grid current is a real problem as is maintaining tuning should one opt to go that route. It might have been a bit more productive to discuss the issue a tad. This particular problem was a real one in the earlier days, especially when the budding SCDXA member found that his old linear caused the protection circuitry to cycle like mad on his new solid-state exciter. In the case of CBs, when you don't have a lot of drive power to begin with in stock form the issue takes on still another aspect. How would you do it?

3. You guys can sort out Bird wattmeters with no particular help from me.

It appears you have a need to be the smartest guy in the room. OK, you're The Man. We will even award you the Pretty Pink Painted Pisspot as a symbol of this achievement. Now will you knock off the pedantry and potshotting?

Affiliated as you apparently are with one of our fine institutions of higher learning, wander over to the Social Seance area and ask them about Myers-Briggs and the Type Indicator. I am an ENTP which are far more common in academic circles than in real life -- which is why a number of noted entrepreneurs got flunked out. Don't hang out there too long or you will be buried in the psycho-babble but a bit of knowledge in this area would serve you well.

As indeed they should. But the first step is to determine that 1kw is indeed coming out without giving credit to harmonics and parasitics and that it is somewhere near linear on a scope which among other things stresses the power supply a tad.

And what is wrong with using microwave oven transformers -- usually built outside of Milwaukee by Advance division of Maggotbox BTW -- for my power supply? If the secondaries are internally grounded we can always mount them on posts and create a first-class deathtrap.

For the filament, I know where I can get a rusty old TV transformer. The primary is wound at 6 turns per volt. After gutting the secondaries,

winding a moose filament secondary is duck soup.

The El Cheapo trophy is MINE. The chassis will be the cases from the microwave oven bent to suit. The only thing to fear is 2450 MHz parasitics. The plate tank coil will come from the copper tube on some poor soul's icemaker; hell, steal the whole icemaker and build a motorized tuning cap.

The antenna will be built using stolen windchimes. No risk of getting caught, the victims will be convinced their neighbors did it. Especially if you steal the bugzapper at the same time.

This is turning into a fun project.

2648. FRS Distance Record Set In North Carolina Test

Newsgroup: rec.radio.cb
Date: 2001-03-31 13:41:35 UTC
From: qrm2000@aol.com
Message-ID: <20010331084135.09517.00001426@ng-mp1.aol.com>
Source record: 76923

FRS (Family Radio Service) is a license-free band in the UHF spectrum. Radios are 1/2 watt with fixed "rubber duck" antennas. While designed as an "intercom" for families, some folks cannot resist the temptation to test them for maximum distance. Here are the results of one such test:

Participants in the March 30th test:

Nathan, KB4CWR on Mount Mitchell
Bill, KG4LOV on Grandfather Mtn
Paul, K5PF on Pilot Mtn
John, KF4WNC on Moore's Knob at Hanging Rock State Park

Diagram:

0--------------------0------------------------------0--------0 (line runs SW to NE)
Nathan Bill Paul John

Actually, Bill's position should be slightly above the line, but I don't know how to do that with a computer within an e-mail program!

John was the first person in position, after a minor incident where he fell in a creek and got his shoes wet. Just what one needs when hiking a trail which rises over 1000 feet in just over a mile!

Paul (and wife Sandee) arrived at Pilot Mountain about 11:15 AM and immediately made contact with John. The distance between Paul and John was 13 miles. They chatted for about 15 minutes, and then Paul took some time to get ready for the BIG test and to take some photographs.

Just before Noon, Nathan reported on 146.52 simplex that he was beginning the ascent from the Blue Ridge Parkway to the parking lot at the summit of Mt. Mitchell. He indicated that he had been hearing radio traffic between Paul and John as he approached the entrance to Mt. Mitchell State Park. He also relayed a message from Bill that he was enroute to the parking lot on Grandfather Mountain.

Right on schedule, everyone was in place and all equipment was working. Taking turns, each test point made contact with all other testers. Grandfather Mountain to Pilot Mountain (75 miles) had been accomplished earlier in the year. Here are the results from Friday, March 31st. (Distances computed from the NC State Road Map, on a scale of 1 inch = 13 miles. GPS figures will follow).

Grandfather Mtn to Hanging Rock. 93 miles
Mt. Mitchell to Pilot Mtn. 110 miles
Mt. Mitchell to Hanging Rock. 123.5 miles

Stock FRS units made the trip just fine! In most cases, the signals were full quieting and broke the factory-set squelch. Over the longest distances, moving an inch or two sometimes made a difference, as did holding the radio arm's length in the air (on Pilot Mountain).

We began the test on Channel 1, with invitations for other stations to join us. We switched to Channel 6 for a few minutes, but Paul and John were overcome by intermod and adjacent channel signals from pagers and broadcast towers on a mountain halfway between them.

The FRS Mobile FRS was not used in this test. Bill has one, but he didn't want to add another antenna to the roof of the truck, where he already had 2 meters and 15 meters.

Other details:

Some of the test with Mt. Mitchell was done in the parking lot, just below the summit. However, Nathan braved 8 inches of snow and found the trail to the observation tower, which put him "on top of the world" with a 360-degree view from over 6000 feet. Bill reported conditions on Grandfather to be better on this trip than during the earlier test when 80 MPH winds (measured speed) forced him to retreat to a lower elevation. Other than wet shoes, John had a great time and spent many hours on top of Moore's Knob. Paul and Sandee had the easy position--paved road to the parking lot 1,000 feet above the valley floor, and there were drink machines and restrooms at the test site. Sandee spent a lot of the time watching birds with the binoculars, since Pilot Mountain attracts some unusual species.

The test concluded at 12:30 PM. Some folks hung around the test sites to take advantage of the height, making contacts in other radio bands.

Respectfully submitted,
QRM

One obvious solution would be to limit the grid to stay below the
cathode. Power out is reduced, but is are the power input requirement.
Still, I wouldn't mind your opinion on a 'power phase-splitter'.

Cool! If I insulate the antenna from the mast, I can get it down to SWR 2.4. So that's a START.
Now 2.4 is the best I can get - now what?

That's up to the judge to measure, and the entrant to consider in his
design.

>And what is wrong with using microwave oven transformers -- usually built
>outside of Milwaukee by Advance division of Maggotbox BTW -- for my power
>supply?

Nothing at all, just don't forget to knock out that extra core piece.

> If the secondaries are internally grounded we can always mount
>them on posts and create a first-class deathtrap.

I think most of them are grounded on one end, but that doesn't mean
you can't use two of them in phase.

>For the filament, I know where I can get a rusty old TV transformer. The
>primary is wound at 6 turns per volt. After gutting the secondaries,
>winding a moose filament secondary is duck soup.

I think I have the core you want: It came from an old isolation
transformer, it uses four U-cores to make tandem torroids through a
common bobbin. The bobbin still has the primary, 248 turns of #11 BWG
and was rated for 230VAC at 15A. It even came with a ventilated case,
and weighs 30lbs+ (without the secondaries).

>The El Cheapo trophy is MINE. The chassis will be the cases from the

What's worse is when the SWR meter reads a 1:1 when it's really 4:1.
You should be able to check it with a dummy load.

"Hi hi hi", is laughter? Sounds like a stutter to me. The laughing has died down a bit, which resulted from your girlie friend screaming for help in "ganging up on Twistie with my own dedicated ng. because he beat me so bad here in public that I need all the help I can get because I can't handle him by myself and everytime I open my mouth twisted makes me look like the true ass I am in front of millions of people." Now that was absolutely hysterical and classic. I realize you are a troll, Kari, which is why I do not reply to all your drivel, like your two regurgitative pals. You want to talk about avoiding questions, ask your hypocrite girlfriend to answer a question posed to her about breaking the law. She picks and chooses what laws she obeys then throws tiny little pebbles at us. Twisted pissed? LMAO! You girlies don't have enough moxie to piss me off or for me even to take you serious. You are following in your girlie friends steps, giving yourself too much credit. Have you noticed she only exists when I say she does, here? Seems like you are beating down the door to attain the same status..that isn't a problem. You guys are almost exactly alike, like I said, why don't you post a porn pic to solidify the credibility you are bucking for so hard, along with the other two? Your girlfriend jumps up and down DAILY for my attention. Who is pissed here, sonny? You can poke your nose anywhere you want, doesn't matter to me one way or the other. You say what you wish, and so do I. Only what I say dictates your behavior and drives your girlie friend bonkers, to the point of no return. Can't stand what I have to say so y'all curse, malign, lie, project your pornographical fantasies here, and try to be another (which, by the way, we hold y'all totally blameless here, we do understand that aspect.) Thanks for the invite to the Finnish groups. I know I am welcome anywhere I go..I seem to have that effect on people, but I really didn't need you to remind me. Have a great weekend. :)

'Stiff' bias supplies are a requirement in any linear service. You can't have the operating point drifting around under load. Feeding the screen separately is also required but with about 25 ma of screen current regulation is not nearly the problem it is in the grid circuit.

Remember I have always done my thing in an environment where drive power is not a problem so my approach is to give the exciter a 50 ohm load and move on. I have enough fun in my life matching antennas. I wouldn't know a power phase-splitter if it drove over my toes on its little red tricycle.

You do have to work a bit to get push-pull drive which I have accomplished with either a tapped tank (the first transmitter I ever owned did that with plug-in coils) or the old-fashioned link-coupling techniques. This bit of Mickey Mouse explains why most units are either parallel or single-ended. Jerk-shove is neat in audio but a major pain in the drain for rf; the gain in linearity is not worth the effort and it requires some complication in the plate tank as well.

Remember that my experience is Amateur and Broadcast. This implies either multi-band operation with its complexities or equipment that will run 5kw plus into a dead short. I may not be the person to ask.

Message-ID: <3AC6070F.64D1@bellsouth.net>
Source record: 76938

Yes,

Some hams do illegal things just like CBers, but it is not indicative of the entire hobby. Out of the vast number of frequencies available to hams, it is hardly fair to lump all hams into an "illegal" catagory just as it is unfair to assume that *all* CBers are illegal. It is unfortunate that the actions of a few reflect unfavorablly on all. What you *may* hear on a few frequencies does not mean that everybody is using illegal power or constantly arguing with each other.

High power is not as prevalent on the ham bands as you might think. Just like CB, there are some who believe they need to be king of the hill, yet most of us run around 100 watts. As to modifying rigs, expanding frequency capabilities, yes, many will do that. *Most* will never transmit, some have licenses for MARS, some are, indeed, members of CAP. I happen to be a CAP member, and, yes, my HF radio IS CAP capable. I do have the requisite licenses and permission to operate on USAF/CAP frequencies as well as FEMA, US Coast Guard, our State VHF rescue frequency, and even Highway Patrol. The radios used for VHF are mil. spec. radios, and manufactured by a company called Tait.

The "power freaks". As mentioned above, yes, they are there, unfortunately. In my case, high powered amps really don't interest me. I DO have a mobile amp, but it hasn't been turned on in 6 months. What power freaks don't realize, apparently, is that high power is not necessary to establish and maintain good communications. By NOT running BIG POWER, one is not as likely to hinder communications in other areas and lands that he may not even be able to hear. Personally, I believe ham amps should only be used as backup for emergencies and, waaaal, they are useful when trying to work one of those rare DX stations. LOL! But mostly, they are not necessary.

Contrary to your apparent belief (the way your post reads), the renegade hams are small in number, and usually confined to a few frequencies with in a particular band. Still, their activities bring embarrassment to the rest of us and dismay at the damage their antics do to the hobby.

Radio Equipment Sale

Albrecht AE-485S 26.000 / 30.000 Mhz All mode HF trans --- ï¿½140.00
This radio is as new and under 10 weeks old.

Zetagi B300P 200/400 Watts All mode amplifier --- ï¿½50.00

Mass KM 2500 Echo/PWR Microphone (600Ohm) --- ï¿½25.00
This Microphone is new in the box RRP ï¿½49.95.

Y-Quad Antenna 2 Element + Rotator
Horizontal/Vertical Polarisation 26.000/30.000Mhz --- ï¿½80.00
14Dbi Gain (4 foot Boom) U.S.A Imported.

3 Element Beam (spitfire)
--- ï¿½20.00
Beta Matched.

Emperor TS5010 26.000 / 30.000 Mhz All mode HF trans --- ï¿½140.00
This radio is like new and under 12 months old.

President Jackson 26.065 - 28.000 Mhz All mode trans --- ï¿½100.00
Very nice condition works very well.

Rotel RVC230 80ch radio
--- ï¿½35.00
UK/Cept freq.

RMS 301 Swr/pwr Meter
--- ï¿½15.00
Pwr to 1.5Kw readout vgc conditon.

Alinco DJX-10 comms receiver all mode --- ï¿½140.00
Boxed as new 100Khz - 1999.9Mhz hand held.

Realistic Pro2042 Scanner Receiver ---
ï¿½140.00
25Mhz - 1.300Mhz Fm/Wfm/Am mode 1000ch.

All Enq to e-mail or phone Steve On 07747836193 or Simon On 07950287599
TRADINGS PART EX POSSIBLE.

Yep, Jack, the situation gets worse all the time. So sad about ten meters-
however, a guy who uses illegal gear on eleven MAY be tempted to work on
ten, too - as we all know. Many a time have I suffered from U.S. pirates on
ten.
So, that's it now, you take care and we'll talk some more some other time,
Jack.

I hear you already!

The thingis, at one time, I used to be just as guilty of using Amateur HF gear on 11 meters.
However,after a few too many incidents with the locals and too much H&D otherwise,
I gave up the HF rig (traded for a nice shortwave reciever) and I've been a whole lot happier
since! Thattrade was 7 years ago and I haven't looked back.

One of these days, I'll consider getting my general, and then go back to HF

with a properly verified ticket and work the big boys on 10, 12, 15, 20, 30, 40,
75/80 and 160 meters... 11 meters can do its own thing (hell, I might even buy a used
148 gtl and plunk it on the battery here and work everyone LEGALLY using a part 95 approved device!).

However, until then, I'm happy just listening, logging and sending swl QSL's.

gee,
you talk a big line, but when it comes right down to it, youi are
only telling HALF the truth (your e-mail address is a lie!).

There are some that do as you say, but they are in the minority.
there are plenty who will gladly pay for NEW equipment from
the store, but don't advertise it. why? they don't feel its anyones
business what they got or when, just that it works good.

and yes, if you shop around, you can definitely find good deals
at a ham fest (which is more of a market then anything else and price
haggling IS expected).

so Dave (if thats who you REALLY are?), get a life!

also, with reference to your comment on welfare checks,
some folks just don't have a choice (due to disability, etc).
until you start getting one, don't crow to loudly about it!

Once the 'commercial' radio is modded for Ham use, it is no longer 'type accepted' for commercial use and no longer legal on 'commercial' bands. (not saying it isn't done). The modded radio becomes a Ham-band only radio in the eyes of the FCC.

You may also want to take a peek at the rules and regs for Amateur radio... the regs allow the use of ANY (let's say that again.... ANY) frequency available in an emergency, regardless of what service it's assigned to.

Okay, here's the deal. I pulled the mast out of the ground, and pulled out all of the guy wires, in effect removing any contact between the antenna and the earth. That brought my swr down to 1.5.
SO, I'm on the right track.

We hear a lot of hams on FRS with their modified 440 rigs, forgetting to
NOT use their call signs. So the guys who don't know about ham radio
copy the hams call sign, a laugh a minute.

I wonder how much extra distance a external antenna would do on the
roof?

2676. SOLVED IT!!

Newsgroup: rec.radio.cb
Date: 2001-03-31 19:14:27 UTC
From: Mike Bleiweiss <g@g.com>
Message-ID: <tccb4n9d7kq488@corp.supernews.com>
Source record: 77250

Okay, here was the problem. Actually here WERE the problemS.

1. I was running my coax from the antenna at the top and tying it down the mast down under the dirt. When I unburied the coax and ran it straight out from the base of the coax connection across the yard into the receiver, it subtracted 1 point off of my SWR.

2. I UNgrounded everything, and ran some 4' radials coming out from the mast about 6' below the antenna, and then tyed them straight out using nylon rope.

I'm now getting an SWR of 1.4.

THANKS EVERYONE FOR YOUR HELP!!!

Hello Mike: Good going!!!!!!!!!!

I always like to hear when one of the guys geting something going.

One thing that is hard to do is, give good advice over the internet
here. Its better to there in person so that a expenced guy can look it
over ect.

I would what a few cold beers, tell you old war stories, track in dirt
on your carpet, want a few more beers, have your wife ask "when is he
leaving" tell you about bigger and better antennas and such, and be a
general all round pain in the ass in a short period.

But is does sound like the coax is radiating.

Jay in the Mojave

2678. Sigh... new problem

Newsgroup: rec.radio.cb

Okay, now that my radio is running really well - I have a new problem.

I'm not running an amp or anything like that - but when I speak on the mic you can hear me on the TV, the stereo, and on the cordless telephone. Who KNOWS what the neighbors are hearing me on - and they've all seen me put up a big-ass 30 foot antenna this afternoon. Once they put two and two together.... they're gonna start ramming my front door and running in with torches to lynch me until I take my antenna down.

What do I do?

OK, this is the stuff I live for. I have a few questions and a minor thought.
1. How many speakers on the stereo and how long are the wires? Try lengthening or shortening the speaker wires by a couple feet to see if it makes a difference. The wires might be a resonant length.
2. Is the cordless phone an older 49 MHz model or a newer 900 MHz or higher model?
3. Is the TV getting its signal from an antenna or cable, and if from an antenna, where is the antenna in relation to the 11 meter antenna you just installed?
4. How is your transceiver grounded? All of the devices being interferred with are electrical and are running from house current. They might be on the same circuit as the transceiver, or they are getting RF back on the AC line.

The first thing to do is look at the manner in which the radio is grounded. I'm going to make an educated guess that it isn't grounded at all beyond being plugged into the house's electrical ground system, and that is permitting rf to flow back to the other devices. This being the case, your nighbor might not be hearing a thing. On the other hand.... :-)

The neighbors are complaining already. Everything checks out.... how is it possible that I am causing SO MUCH RF interference? A friend of mine called who lives 2 blocks away and said that ever since I put my antenna up his TV is fuzzy on certain channels.

:(

My wife is PISSED now. There's a big-ass antenna in the backyard, I tracked mud ALL OVER the house by going inside to check SWR, going outside to adjust, going inside to check SWR, etc.

Doesn't matter much now. I realized that the inter-electrode voltages
would be way too high for such an idea to work easily.

Hello MD:

The new base antenna the Interceptor Ten-Thousand (or I10K) is coming along ok. A "proof of concept" antenna has been built, and tested. It has a few more dB in field strength tests as compared to the Mastodon 5K, Proto type antenna. Again this isn't because the antenna is better, but the unwanted loss's in the impedance matching circuit have been reduced significantly.

Have a few problems with special hardware (custom made stainless steel square U-bolts) that has to be specially made is now the hold up. And hopefully this will be resolved in just a short time.

Because the I10K can be tuned from 24.8 to 33 MHz. I have quit a few guys wanting them for 12 meters and 10 meters, what's the big attraction to 12 meters is I don't know, but locals seem to use 12 quit a bit.

There's a 20 meter version that I want to pursue, with a remote controlled antenna tuning unit, that will cover 7 to 35 Mhz, on the back burner. I made a half ass 20 meter full 5/8 wavelength ground plane antenna, and it worked surprising well on 20 thru 10 meters.

Other projects that are also have the back burner priority are a scanner antennas, beam antennas, and a vertical all band antenna.

Try coiling up your excess coax. 5 or 6 turns should do it. Let me
know what it does. My guess is that the SWR will go up.

The 6JE6-C is rated for 47 watts running Class AB1, which probably
means your amp will do something around 100 watts. But those tubes are
real power-hogs, they suck up 2.5 amps for the filament. Not much
headroom either, so watch your modulation or your RF will get real
dirty.

The transistors make a solid-state vibrator - a power inverter to
pump-up the voltage needed to run the tubes. Replacements are
available, but If they work they should be left alone.

Sparky, FLCD

ILLEGAL CBERS!

HATE HEARING HOW YOUR AMPS ARE ILLEGAL?
ANNOYED THAT YOUR EXPORT RIGS ARE UNLAWFUL?

NOW you can avoid confronting THE TRUTH!

Use your killfile to block out people saying that you are illegal! All it takes is a few keystrokes and YOU TOO CAN BE LIVING IN A FANTASY WORLD where amps are okay and bootlegging is cool!

Geno,

Certain amateur radios *can* be made compliant with NTIA regulations. This is particularly true with CAP and FEMA. For example, certain Icoms such as the 706 series, 746, Kenwood TS50s, TS450s, and others are authorized with the installation of the High Stability Options. This, of course, is for HF operations. As a matter of fact, one MUST install the HiStab. filter to operate on the government freqs. Just to clarify, the licenses issued to CAP radio ops are issued thru USAF/CAP which is governed by NTIA, and FCC has NO jurisdiction. Therefore, a licensed CAP station CAN operate on FEMA freqs under certain conditions, and they are authorized to operate on the CAP/USAF frequencies. All Riley could *do* is just stand there and watch, not that I am trying to "diss" him. NTIA sets the standards on which radios are allowed to operate on US gov't. frequencies, and *some* amateur rigs can meet those specs. There is a list of radios that can be made compliant on CAP's national website, and quite a few are amateur rigs. (Thank goodness! --I'd hate to have to buy a $2,000 Motorola! LOL)

I was, perhaps, unclear about the VHF bands. Currently, there are no amateur VHF rigs that meet the NTIA specifications. I did mention that for operations on USCG, USAF, and State Rescue bands, we currently use certain rigs manufactured by Tait, which is a mil. spec. radio specifically built to the narrow band requirements. Motorola and Harris are a couple of other military contractors I didn't mention. You are correct that I cannot just operate my 706s on said VHF bands--they won't meet the NTIA specs on VHF. On HF they do. The radios installed in the CAP-owned vehicles are Tait 2020 series radios, and are programmed for CAP, USCG, State Medic/Rescue, and Highway Patrol. I hope this clears up any misunderstanding.

>I wonder how much extra distance a external antenna would do on the
>roof?
>

It helps. Actually, there is a companion radio service (license required, but no test) which allows external antennas, so we have a good basis for comparison. On a vehicle, the distance covered increases from 1 mile to 2.5.

Experiments indicate that the antenna and its height make more difference than increasing power.

My D104 Silver Eagle took a spill this morning on the floor. The head was a little bent and in trying to straighten it out the connector on the neck of the mic base broke. Where can I get a replacement for this? It is the three pin jack that sits on top of the neck where the head screws in. Thanks!!!

Mike, Sparky had a good point in his reply to your last post. Your coax is likely radiating (ie; the RF ground still isn't great - but likely is better than it was). If the coax is not radiating, it will make no difference if the coax is in the air, buried in the ground, or run through rigid conduit! Sparky's suggestion about 4 or 5 turns of the coax would seem advisable. Make the turns of the coax very near the antenna. This will choke off RF from the outside of the coax. If your SWR goes up (I'll bet it does), it means the coax is (or was) radiating. The coiled coax will eliminate that. It may mean you want to work a bit more on the ground. In any case, if your radio is a stock CB and hasn't been 'tweaked', your harmonics and spurrious emissions should be down over 40 dB. Add to this the fact that television is horizontally polarized and your vertical is (obviously) vertically polarized, this adds up to any unwanted emissions in the television band down 60 dB in the neighbor's antenna. This means an effective radiated power of 5 microwatts - unlikely to cause a problem for more than 50 or 100 feet at best. If the coax is radiating, however, that signal will be horizontally polarized and eliminating that will help any tvi. Also, eliminating the coax from radiating will likely eliminate (or largely reduce) any interference in your house. The telephone, stereo, and such devices experiencing interference are the cause of the interference - not your radio. They are detecting the signal somehow. Eliminating any horizontal polarization and eliminating signals real close to your house will reduce the signal in your house and reduce any pickup by audio devices. Put the loops in the coax by the antenna and let us know how you make out. Is this fun, or what?

BadaBing, I know how you feel. I would feel the same way; unfortunately, the last thing one wants to add is real discontent amongst the neighbors. Before Mike can, in essence say that, is to prove he has no interference in his house (which is, obviously, much closer to the antenna). Right now, he cannot - even though we know the problem with a telephone is the TELEPHONE. Even if he eliminates all of his own problems , all he would want to do is prove he has no interference when he is on the air (obviously, must be someone else).

One could say the same about drag racers, and they've only got 5
seconds!

Would you call them losers?

Are you using Cheap Coax? Example Radio Shack grade. Try using some RG-213, or possibly RG-214. From a Ham Store, or CB shop those places usally buy better Quality Coax. If that dosn't fix the problem you should try to find out if the antenna is at resonance around 27.205Mhz.

Hello Gary:

Well how many people have you impressed with you snotty and unfriendly
posts here, no one. What a turn off to the fraternity to ham radio you
present your self as.

I would think you would like the swell of napalm in the morning, the
next time the Soviets do a little dance over your boarder.

Keep the Rock n Roll turned up.

Hello Mike:

Glad to see you have gotten some really good advice from the guys on the news group here.

Its real possible you are trying to put diamond ear rings on a pig. Meaning no matter what you do to the this particular antenna is wrong. I have mounted cheap mickey mouse mobile antennas to the rain gutters and had reasonable success with them.

The world of antennas and such is one that needs to be approached with massive caution, before consuming mass quantities.

The mobile wire wound antenna may work ok over a metal body like a car or truck, but may act like a pig with out it. It appears to be doing so.

The mobile antenna for a base station, will not work like you it want to.

If your gonna play ya gotta pay. Suggest you install a MaCo V5/8, which is a 5/8 wavelength (about 21 feet high, with ground plane radials) on top of the roof, or up against the side of the house, the higher the better. Also the use of LMR-400 coax, it much better stuff.

There are professional antenna installation guys out there in the phone book. Also do not install the antenna, so that if it falls it won't go into power lines, a lot of guys still do it. I will not do it, the hobby just ain't worth killing someone of setting the house on fire or both.

I have heard way too many experiences from CB'ers and Hams that have replaced their A99 or other antennas with a good 5/8 ground plane antenna, and eliminated or significantly reduced a interference problem.

But this may not be a cure all for interference problems, but is a great start.
The ARRL has a couple of books on the subject, there at:

http://www.arrl.org/catalog/index.php3?category=Interference%2FDF

I use to have a A99, then a ABS1600, then a Penetrator 500, and even with the Penetrator 500 I gave interference to my next door neighbors phones. From the FCC web page they gave manufactures that sold RF proof phones, and that did the trick, a cheap investment in keeping the peace at home.

Hope this helps, let us know how you make out.

Probably.

One suspicion is that maybe your whip is either cracked or blown open
like a fuse. I have only seen this a couple times before, but it's a
bitch when it happens. Expose some copper at the tip of the whip and
check against the bottom for continuity. If it shows open, then that's
the culprit.

If not, then this next part is going to seem so basic that it might
insult your intelligence. Check to make sure that:

1) the center conductor is connected ONLY to the antenna whip;
2) the shield is connected ONLY to your ground plane, and NOT to the
mast at any point.

Wind a few turns of coax around the mast just below the antenna and
test. If everything is working as it should, your SWR should be
reasonable, you should now be able to adjust your whip and ground
plane for the best SWR, and your neighbors should be happy. Let me
know if that doesn't happen.

Yeah, most of what you were radiating came from the coax, not the
antenna. Now I'm pretty sure that either something is not corrected
right or the whip is bad.

Well, you definately have something wrong and it's probably real
fundamental. Beyond what I have already said, I would suggest you
check out a radio comm book at the library. There are a lot of pages
on antennas, good and bad. Andy knows where the good ones are.

Good luck,

Sparky, FLCD

Greetings!

Well, I'll take a stab at this - sorry if I tend to skip, I've been reading this thread and with this message, I backtracked - only to find the original message from you is off the server.

The only things I need to re-check with you are...

Did you find out if the antenna is for CB and is not a scanner antenna? Two different frequencies of interest - one needs a CB antenna.

Mounting - I'm thinking you're using something like a mirror mount. I also assume you've checked to make sure the antenna, stud and bracket holding the antenna to the mast, are not shorting together. You should have a ground, or a good connection to the shield of the coax, to the mast and antenna bracket, and not to the center of where the antenna mounts to the stud.

This means, drag the radio end of the coax out with you and re-check for continuity from shield [outer ring] to mast and to the mirror bracket. Checked from radio end of coax, to the mast pipe itself.

Do the same for Center, it should only show continuity to the antenna stud and antenna itself. Once again, from radio end of the coax, to the antenna and NO CONTINUITY [open circuit] to ground either at the shield [outer ring] and to the mast and bracket.

Short only to shield, to ground mast.

Short only to center, to antenna ferrule.

Opens indicate broken/loose connections.

Shorts from shield to center indicate pinched coax or a simple assembly problem.

If any of the above tests fail, as in a short or continuity, or open at either check. This would explain why the SWR is so high. The coax could have gotten mangled during the assembly. You may need to replace the entire coax.

I have helped a few people get their mast pipes properly mounted and grounded into the ground. The process was pretty simple, use 2" hard wall conduit with threaded ends - at least two sections. Pound one into the ground it's full length - the threaded ends can be protected

from the pounding by using a cap and a fence post pounder to pound the masting into the ground.

The cap can be unscrewed and the other conduit section can be screwed on to the section left just above the surface.

Guying the antenna is a good idea, so keep the guy wires - at least three of them to make a tripod support. These can be grounded again if you wish - a longer length of guy wires and conduit/pipe into the ground is recommended.

The above may be overkill, but it reality it is not. You are not only grounding the antenna, but supporting the mast to hold this beast together.

The only suggestions I can give you otherwise is to re-check all mountings and make sure the antenna is a true CB antenna. The coax needs to meet 50 ohms impedance - so anything with RG-58, RG-8x or RG-8 [thick stuff] listed on the outer jacket should work.

Firestik offers a 2M 5/8's wave antenna that is similar in design so it is a good idea to double check the antenna by swapping the antenna to another mount - like a mag mount on a vehicle - to re-check to see if the "tunable tip" and the coil section just below it are still connected. Should show a low SWR and be tunable.

It's rare, but some Firestiks are too tightly wound and some flexing of the antenna and the coil with breaks its connection to the tunable tip - making the antenna show a high SWR too.

On Sun, 1 Apr 2001 09:22:27 -0400, while the modem was ice fishing with the Mouse, "Mike Bleiweiss" <mbleiweiss@laurelholdings.com> dissertated the following:

This 6 meter junkie that posted this has made it to the KILLFILE.

Ahahaha! Having anon.xg.nu, ynn, deja, cotse, and a few others blocked turn the ng instantly back to what it used to be. Thanks for posting though, clown town. I almost went the entire week without seeing a post from Hermie. I almost missed the opportunity this weekend to make a fool of Hermie in front of millions again, thanks for reminding me.

Source record: 77177

X-Force and similar boxes with carousel combiners are very particular about the driver and radio you use. You have to buy everything from one place so it will all match up. Also, these type boxes cannot withstand high deadkey. They have to be keyed low and swing forward. They will produce the most watts but you may limit your keydown time. Foxie uses the conventional stair-step design for her combiners. This design is compatible with almost any other type of radio or box. Her design is very good for skip talking and will give the most trouble free performance. The watts as compared to other stair step designs is equal and can be sucessfully used in shoot outs with the proper antennas.

As you are new to the radio, I would recommend the Foxie boxes first. You will have no trouble getting set up and Ms Foxie will give you any technical support you need. Later TAKE CARE FROM SUPER IN THE BAYOU YOUR SUPER BOWL BIG BOY!

Was away from the group for a while,come back its the same old bs,ham's x cb'ers,so here I go up on the soap box,and add my 2 cents worth,and maybe a little bit different prospective.
I think the only hams that should be offended at the illegal use of the 11 meter band are the old-timers that gave up the band ,way back when,its really none of your business what goes on in a band if you don't have privileges there,is it?likewise to what sort of gear someone runs,most H.F. rigs sound a heck of a lot cleaner,with a lot less problems than a pumped up CB,let alone one driving the average cb linear. That is unless you have other problems,similar to the ones that Freud spent years theorizing about.
I myself view the open usage of the so called other freqs. more of a world wide societal uprising,I shall use that word rather than problem.very similar to back in the late 60's when a large number of legal licensed cb'ers quit using there assigned call letters and went to using "handles".
I think that to most users,its a way to say ,hey back off,whether your an American user,or one from a variety of other countries.
A bit of self wrought freedom in what's quickly becoming a repressive world.
Radio these days is not a new technology as it was in some years past,and I believe that we are seeing the citizens of a world radio community respond to that I guess the proper wording would be "Social Evolution",

BIG TIME will the ext. antenna do. What does this have to do with CB ? !
I once did an external antenna 15' high on a house roof on a 46/49 cordless
phone that went just over 1/4 mile into the woods, sloped down a little. I
know you commies won't like that, but TOUGH !
Dave!!!!!!!!!!

"Jay in the Mojave" <jay123a@qnet.com> wrote in message
news:3AC62A9A.41F5273E@qnet.com...
We hear a lot of hams on FRS with their modified 440 rigs, forgetting to
NOT use their call signs. So the guys who don't know about ham radio
copy the hams call sign, a laugh a minute.

I wonder how much extra distance a external antenna would do on the
roof?

You are the same asshole who was peddling this shit a few months back. Miss Foxie is not technican she is a box builder, she builds what she was taught, she will tell you the same...

"WestSide Jam" <CreoleCat@webtv.net> wrote in message news:24890-3AC74774-52@storefull-238.iap.bryant.webtv.net...
X-Force and similar boxes with carousel combiners are very particular about the driver and radio you use. You have to buy everything from one place so it will all match up. Also, these type boxes cannot withstand high deadkey. They have to be keyed low and swing forward. They will produce the most watts but you may limit your keydown time. Foxie uses the conventional stair-step design for her combiners. This design is compatible with almost any other type of radio or box. Her design is very good for skip talking and will give the most trouble free performance. The watts as compared to other stair step designs is equal and can be sucessfully used in shoot outs with the proper antennas.
As you are new to the radio, I would recommend the Foxie boxes first. You will have no trouble getting set up and Ms Foxie will give you any technical support you need. Later TAKE CARE FROM SUPER IN THE BAYOU YOUR SUPER BOWL BIG BOY!

It's human nature, if one is an ass, to be proud of one's assinine accomplishments. Being able to illegally emit 10,000 (or more) watts of RF from a moving vehicle and screw up the band for all the other CBers is definitely a criminal, asinine accomplishment.

Your ground plane is the other half of the antenna. You must hook the shield up to 4 wires 1/4 wavelength long (about 108") These wires must be in the space of a plus sign. For proper impedance, they should be at a 45 degree angle. These wires need to be right below the base of the antenna. These wires will also uncouple the RF from the shield of the coax. I recommend using RG8M or RG8 as a minimum. RG58 is so lossy, I won't even use it in my mobile. Finally, do not use the mast for a ground plane. If if were the right length and not grounded, you could have made a dipole, but ground plane is more effective by a slight amount. Once everything is working, you should get a longer antenna. My experience has shown that a 4' Firestik is only 50% as good as a 7' Firestik. I've got a 4' that someone gave me. I never use it.

I went out and got a Solarcon A99. I stuck it at the top of my mast, and now I'm getting an SWR of 1.1 - 1.2, even with the caox coiled 5 times just below the antenna. Looks like all's well! Now I can enjoy the radio without having to piss around with that antenna..... until I get itchy to tweak with it or get something better.

Until then!!

Thanks a million guys, I really appreciate all of your help. I couldn't have done it without you.

Source record: 77313

actually I have a d104 that is good outside:
the neck is good with good chrome the 3 pin connector is good and the head
and element are good (good chrome too) this mic was working until someone
took out the board at the bottom (still missing) I'm sure it still works if
it were wired up just wouldn't be amplified. This mic would be great for
spare parts or whatever or you could just throw your amp board into the
bottom and its ready to go. One more thing I should mentioned is that the
base has been painted (and chipping off) and the volume knob has been turned
around and consequently there is a hole drilled in the base for it. But all
the parts you want (need) are still good. Give me an email if you feel you
might want it and offer me whatever and well go from there

The Connex 3300 is now JUNK because it is made in RED CHINA now! It will probably be like the Northstars, just another cheapened up Galaxy! Chinese Clone leave me alone!!!!!
Dave

I tend to agree. I don't like the stars either. Even taking the damn covers off some of the bases are a joke. Giant assed box for no good apparent reason. Way over overcomplicated in some areas and shortcuts galore in the board circuitry quality.

You need a coax switch, to put the antenna to one place or another, NOT a "splitter."
Dave

"Darrin" <nospam@nj.rr.com> wrote in message news:m7v3ctsq8rq9iife7a80eidoddl8nu8hp9@4ax.com...
I have 2 rigs. One in the bedroom , and one in my "radio room". I have a splitter on my antenna. I never have both radio hooked up at once. My bedroom radio goes right to the antenna and the SWR is about 1.5. My other radio is off the splitter, and 50' of coax. My SWR is about 1.1 - 1.2. Is the performance better with the 50' of coax running through my house, plus another 20' outside to the antenna, or is it better with the higher SWR running just off the 20' of coax to the antenna?
FWIW, I've tried to get the SWR lower on the direct connection, but this is the lowest I could get without raising it on other connection, which is more important to me.

Thanks

I passed this thread before, but...

Isn't the Ranger II a transmitter using a single 6146, and only
capable of maybe 75 watts running CW with Class C? And the modulator
uses 7027's? And I hardly think that three 6146's could ever reach the
output of a single 3-500Z running Class A.

Is there something here I missed?

Hmm,

That's the first time I ever *knew* I wasn't having fun! Let's see, I think talking to the Shuttle is fun. Talking to Moscow (No, they aren't a communist nation anymore) is fun on 20 meters, using the local auto-patch and not paying cell charges is fun, talking to Riley Hollingsworth on HF is fun (LOL!), talking to friends I made on clean, quiet VHF freq-is fun because I don't have to listen to "SQUEAK", "SQUAWK", ROAR, "ECHO ECHO ECHO ECHO", or BEEP and profanity every other word. Building pro-jects I learned how to via ham radio is fun. Constructing antennas and knowing WHY they work is fun. Participating in emergency communications is rewarding. Understanding why, how, when and when NOT to use more power than needed is fun. Going on foxhunts is fun. And all this time, I've been so "miserable". NOT!

Jerry

From: h <not@aol.com>
Message-ID: <tcfmp9cmju895c@corp.supernews.com>
Source record: 77331

It was about wireless tech in the pc world and how the government is selling bandwidth for millions to the various teleco companies. Lucily most of the bandwidth is in the upper end of the spectrum due to the need for high data transfer rates. Guess the hambos are gonna be shopping for a Galaxy pretty soon if they want to talk to someone besides their cat:)

Hello Sparky: Yes you you missed a little, all right.

But not far off.

The Johnson Viking Ranger, has the tubes you mentioned. The Johnson Viking Ranger II does have three 6146's class C as a finial, being plate modulated by two other 6146's. And if my memory serves me right, there are other configurations of the Johnson Viking Ranger II, that used 807's and such. I believe that there was a II version that had two 807's plate modulating two other 807's as a class C finial amplifier.

The Johnson Viking Ranger you mention, I have one in mint condition, it sounds like a broadcast station, with a dead key of 20 watts, with good forward or 90% modulation as indicated on my scope. It has a tube, can't remember the tube number, that clamps the audio output of the modulation transformer, and it makes the transmitter sound great.

No I never said the 3 each 6146's have the same output as a 3-500Z. I said or meant that the 3 class C plate modulated 6146's get one fantastic amount of power and great audio from a linear amplifier that has a quad (four each) 3-500Z in grounded grid service.

My neighbor has a modified Heathkit SB 220 (is that the right model number?) that has been modified, two more 3-500Z tubes have been added, while the power and filiment transformers and other power supply components are mounted on another chassie. A Peter Dawl 400 dollar transformer high voltage kill em all dead is used, with a bunch of oil filter capacitors, with relays and and kinds of stuff. More steam than I care to use. But the Johnson Viking II and the amp with the four 3-500Z tubes do bark at the Moon.

What was the model name of the original Johnson Rangers, made in the early to mid 1950's, that used 807 tubes????

You must have a Valiant, which is just as you describe. The Ranger II
is as I said before, and the original Ranger is not much different
except it uses 1614's for modulation.

Johnson almost always used the 6AQ5 for clamping. And yes, they are
great radios, speaking from a technicians point of view.

>No I never said the 3 each 6146's have the same output as a 3-500Z. I

My mistake. I guess I just didn't want to accept the idea that such a
nice old radio like that would ever be used for nothing but a driver
(I'm a purist that way).

Hiya Sparky,

My exact location is KP34 UG, using the Maidenhead locator system. We're
located 100 km from the Russian border (shit!) and the Swedish border is
some250 km to the west. Find a map of Finland and you'll find Kajaani to the
south of a big lake called Oulunjarvi.
Having told you that (hi), I'm already looking at the horizon to see when
the illegals' cruise missiles arrive in the Finnish territory. :-)

We are currently just over the peak of the 11-year sunspot cycle. In general solar activity raises the frequency at which long-haul propagation can take place. A little daylite along the path helps so paths crossing the Equator tend to open first. There are computer programs that will calculate the MUF - Maximum Useable Frequency - along a path and time; they even more or less work. It is a bit disconcerting when the MUF is lower than the mUF (minimum) which is a cute way of saying that you are SOL. In a few years, this will all go away.

Stick around. About the time of the Solstices (Dec and June) you get in the low-VHF range, which is what CB really is, what is called Sporadic E. This is a neat name for something that is really not understood all that well but will produce some shorter hops usually Stateside and at least in the Mid-Continent where I live primarily toward the South and Southeast with lots of exceptions.

The way it is presented the Ionosphere (Heaviside Layer if you have a really old book) is cut up into layers at various heights. The D layer tends to absorb lower freqs and is sunlight charged. So AM broadcast goes nowhere at noon and everywhere at midnite with a shorter skip distance. The F layer is the one most affected by solar activity and can in fact split during high activity into two layers. Being the highest in altitude, the skip is longer. Yes, Virginia, your signals from Oz do have to bounce several times to get to you.

Short message: nothing is normal or everlasting on this set of frequencies.

Hopefully we will all be here (which here is that?), but I can tell you one thing right away: we here in Europe will have no QRM whatsoever from pirates on ten, because MUF will favor 20 meters, and the lower ham bands.
BTW: Don't be desperate, maybe you'll be able to work some Aurora E, Aurora or Sporadic E in the 27 MHz-band in North America then - we do it every now and then in Scandinavia: you just gotta monitor the conditions on the higher HF bands.
How's that for an answer?

Regards, Gary

Chassis grounds and Electrical grounds are 2 different monsters, both of which are necessary.
The pos. and neg. leads must go to battery and you need to have a jumper from chassis of
vehicle to chassis of radio equipment. Chassis grounding will improve the receive, minimize
stray RF energy and provide a path for damaging static electricity to bleed-off .
All HF equipment needs to have It's own chassis ground:radio,amplifier,antenna,swr meter,etc.

If he was in a skip-zone the signals would not be receivable, a skip-zone is
a area where the
RF signals are not reflected back to the earth.
What it could be is Sky-wave Propagation, please read about the "Skip-zone"
and how it
affects long-distance communication.

Excuse me for being so damn technical, "Skip" does refer to the the way RF signals bounce
along the earth's surface when conditions permit.
What bothers me is hearing someone key-down and say: "How bout it skip-land", they appear to be trying to make a long distance contact with someone in their "skip-zone".
But this may work:"How bout it DX land,714Sandpile waving that hand".
Go ahead Axle Jack,Im reading your mail.....

Put into perspective, much of Kari's carrying on and aligning himself with another whacked out troll on the ng suddenly becomes not only apparent, but transparent as well. Below is an excerpt that was an attempt at translation to English by Kari.
The poor fellow you snowed into thinking that you know what you are doing was emailed and invited to partake of your "helpful" posts to the ng and made aware of what really is going on. Run along now and do damage control.

The SAREX-project, ham radio and Paltamo High School got a lot of publicity on TV, radio and press. Mission control of JSC rebroadcasted the contact over the USA and Australia.
-On tuesday on the radio in all 3 national main networks in the news many times. Still after some days more telephone interviews on different programs f.ex. on local Kainuun Radio "Culture"-program on Friday.
-On tuesday evening on two different nation-wide TV-network news, both in the main headlines and newsreport both over 2 min 20 seconds long news.
-Newspapers: Kainuun Sanomat, Kaleva, Savon Sanomat, Iltalehti (the 2nd biggest Newspaper in Finland), Seitseman paivaa-magazine, Vayla (local newspaper in Paltamo) and Helsingin Sanomat (biggest newspaper in Finland) had long and good stories with pictures and in most of Finnish newspapers a shorter report delivered via STT (Finnish News Agency).
-On School TV N.Y.T (N.O.W)-News on Friday April 15 on three different program each over 2 minutes report with headline puffs.

I always just put like a 100 ohm resistor across the pa and ext speaker jacks.
On the bottome of the board of course. Always worked good for me.

Paul,
Using a chassis ground is no better, or worse than using a
ground direct to the battery. There is a ~but~, to that. If
the chassis is grounded well to the battery, theres no big
difference. If the various grounds straps between body/chassis
are not the 'best' in the workld, then the over-all ground
through the chassis isn't very good either. There's no 'magical'
properties to grounding to the battery...

Source record: 77225

: Dennis W. Ostrowski <dwostrowski@lucent.com> wrote:
: Skipp wrote:
:> Hi Dennis,
:> Time to debate the design..?
: Not really, but.....

Ok, then... time to correct your mistakes...

:> There's nothing wrong with the transistors
:> connected to the Vcc supply all the time.

: As long as the leakage currents can be kept under control.
: With Germanium power transistors in a place where they can
: get extremely hot, it is not a good practice.
:> It's fused and a very common
:> practice.
: With silicon parts, not with germanium.

It's really hard to know where to start dispelling all your generalized bad statements. You write a lot of things without supporting evidence or proper references.

One would assume any installed transistor would have very little or no significant leakage current. It wouldn't matter if it were Ge or Si type, both types will try to run away in excessive heat conditions. You make the use of Ge power transistors in a circuit sound like a crime... it's not.

I have some serious heavy duty power supplies which use common Ge type power transistors, running without problems since the 70's. Not a problem even when they run hot in a classic General Electric EP-38 power supply.

:> The term bridged is not really accurate or proper.
: I did not say the circuit was a bridge circuit.
: I said the power transistors were bridged across the DC supply.

They are not bridged across the supply, your still wrong...

: If I were to touch the negative terminal of the battery with my thumb and the
: positive terminal with my index finger I would be bridging those terminals with
: my hand would I not?

If you were to have a string of electronic parts in series, then operated with any supply... AC or DC, the term bridged is not really a proper label to describe one of the parts across the whole power supply. I think you'll find the power transistors have a xmfr winding in series with each device.

:> The amplifier contains a straight forward dc to ac inverter circuit.

: It is a DC to DC converter circuit because the AC is not an output,
: the DC is....

The output of the inverter is rectified back to DC as high voltage. The
portion you were talking down is the inverter section which is a modified
AC source/chopper. When your trying to nail down an issue, you need to be
specific.

:> As I mentioned, the Kris 300m is not a continous duty amplifier. Normal
:> use would not provide enough heat to cause a thermal runaway. The owners
:> manual (of which I have a copy of...) clearly mentions to place and
:> operate the amplifier in a well ventlated location.

: That may be true, but back when I was repairing them, it was the
: amplifier that was most likely to fail under operating conditions where
: other amplifiers survived.

Cannon fodder.., you throw out a broad statement without any supporting
information. We are talking specific about a Kris 300m by itself, not
comparing it to an Alpha or similar quality amplifier. Remember the price
range and type of amplifier it is/was designed to be. It fits the
original requirement(s) quite nicely.

:> The power transistors on the rear pannel are not door knob style.
: That may be true, it's been a long time since I worked on one.

It shows...

: They may have been TO-3 cased parts, but they were Germanium as the
: semiconductor material, and that was the problem.

Again you mention Ge Transistors as a problem, you really need to go
back to the books and study more. The use of Ge transistors is not a
problem in power supplies it's been done hundredes of thousands of times
in the past. It's not as common these days, but Si transistor in similar
circuits is also going down in favor of fets and other newer devices.
You've got to know your old technology along with your new devices Dennis.

:> Most
:> all basic text books describe transistor runnaway, when this amplifier is
:> operated correctly (as described in the factory paperwork, it should be
:> just fine. Your follow up reads like you didn't handle the amplifiers
:> duty cycle well enough and one you had went poof...

: I never owned one myself, but I feel sorry for those who did.

Every electronic device (which includes amplifiers) has a duty cycle. The
higher the duty cycle... the exponentially higher the cost to build it.

:> check the paperwork
:> and I think you'll see the power inverter oscillator is off in the standby
:> position. The transistors are off in the standby/receive mode...

: They shut down the oscillator by playing with the feedback path
: instead of breaking the DC path for collector current.

It's a common practice, nothing wrong with that... Check most of your
common Astron type DC power supplies, you'll find the voltage is
always applied to the pass transistor collectors regardless of the output
status.

: Therefore the leakage current path continued to exist at all times, and
: if the transistors had a high enough current gain the oscillator
: actually continued to oscillate at a low level.

Boy, you really are out there Dennis... and completely wrong. If I had
any transistor with a substantial leakage current, I'd call it bad and
change it out. The classic power transistors often have very low current
gain (>30).

: The Plate voltage would drop to about 60 VDC because any voltage higher than
: that caused enough plate conduction to load down the oscillator enough to keep
: the voltage from rising any higher.
: They didn't all do that, but a lot of them did.

I really don't understand what your trying to write, but it reads like
your trying to fault the amplifier in lew of some lousy or bad
transistor experience. My 300m amplifier works quite well, has no
significant inverter section leakage current and still has the original
parts in service... some 25 plus years later.

: You could put a scope on the transformer leads and actually see that
: low level oscillation.

Every Technician, Engineer and Hack out there will find an oddball problem
or two... three... or twenty in their travels. You statements read like
you found one. So don't shoot the design down unless your qualified to
make statements which can be supported and reproduced many times.

:> : Once that amplifier case got hot enough the process would continue in
:> : what was called 'avalanche mode' even with the amp TURNED OFF!
:>
:> First off, it's not called avalanche mode...

: You are right. Thermal runaway is a more correct description.

: Avalanche mode more precisely refers to how an SCR works, with it's
: reinforcing feedback.

Back to the books with you... it better describes a "mode of device
operation"... not exclusive to SCR's by any means... I have many
transistors here which operate in avalanche mode. Other devices not
designed for said can be operated in avalance mode if proper
considerations are given.

: I saw the process as: increased leakage causing increased heat, causing
: increased leakage, causing increased heat, loop as a similar type of reinforcing
: feedback.

Sounds like the transistors were bad... my amplifier shows none of the
problems you mention, with the original parts.

:> so we know your blowing smoke there.
: All we know is that I did not pick the most descriptive term to
: describe what was happening.

You trashed the whole amplifier based on a repair. I've never trashed
any of the Alpha, Heathkit, Dentron amplifier circuits after a repair
until I've verified it is a real design problem. Then I post my opinions
on my web page... You can see them there now... http://sonic.ucdavis.edu

:> How about thermal runnaway as the proper description.
: I agree that is a more 'proper' description for what was happening than
: the one I used.

It may not be complete, but it is a better description. Even I eat humble
pie once in awhile. It's part of the process of learning... when you stop
learning, your dead or close to room temperature.

:> If a
:> runnaway problem did occur (and these types of amplifiers do fail, like
:> everything that may be abused), the fuse (did you have a fuse in line
:> Dennis..?) would blow.
: Once again, I have never used one of those amps, but made lots of money
: repairing them, thank you.

: I believe the amplifiers were fused and that the fuse blew right after the
: transistors melted down and turned from semiconductors into excellent
: conductors.

Then it was time for new transistors, the fuse saved the operator from a
potential fire.

: I believe the inline fuse for that amp was at least a 20 ampere unit.

: With a battery voltage of 13.8VDC and with 20 amperes of current (the holding
: current of the fuse) the power dissipated in the transistors could be as high as
: 276 watts from leakage current WITHOUT blowing the fuse.

Whoa...! big numbers you throw out there. Actually, kris sent out the
amplifier with a 30 amp fuse in the protection position. It should operate
with about half that amount, 20 amps should be enough... I'll have to
measure it again.
Again, If you have any significant leakage current in a static/idle
(receive mode) state, the power transistors should be considered bad and
replaced. A bad transistor is a bad transistor... Here's a hint... I
often steal them out of really old Motorola tube two-way radios... the
"T-Power" line had great replacement transistors which drop right in...

: So it WAS possible for the transistors to exceed their power dissipation
: ratings without blowing the fuse if their leakage currents were high enough.

If they had significant leakage, they were bad before you started down
the road with amplifier on...

:> The design is very common for the period it was used and often found
:> in many other places like regular DC to AC 117 volt power inverters.

: The 'generic' design was very common, but that particular design was
: just not as thermally stable as the others were.

Others designs are better, others are very similar and work just as well
as my unit does, without problems.

: It is very common for cars to be designed using 4 wheels, but there is
: a big difference between a Corvette and a Chevette.

Most lower priced smaller cars do run well when you drive them off the
lot. After years of travel, my 1953 Buick still runs great with the
original Straight 8 ("mechanical inverter"). I just don't try to drive it
100mph plus.

:> It was not
:> uncommon to see transistor leads tied to the Vcc supply line through a
:> fuse, indeed... it's often practiced in designs made today.

: That is true, but those designs did not have the thermal runaway
: ('proper' term used this time?) problem that Kris 300 did.

And I say that it's not a problem that I've seen to much of... and I've
seen a lot of Kris amps. I'm still using one with original parts in
service and glad I have it around.

:> Large current relays cost real money, why install one when it's not
:> required in a good design.

: THIS I AGREE WITH.

: But if I remember correctly, the antenna switching relay they used in
: that amp had 15 or 20 amp contacts on it.

Those are probably the low frequency AC values. Your results at 30MHz
can and will be different.

:> Tripplite has similar designs in many of their line of dc to ac
:> inverters.

: I would not know because I have never repaired a Tripp Lite DC to AC
: inverter.
: (I have repaired some of their high current power supplies and was not
: really impressed.)

I've done more than my share of them... I'm not impressed myself, but I
have and use them when I want too.

: Hopefully they have much more heatsink area per watt of delivered
: output than the Kris had.

Remember your taking a different era here... Sure If I wanted more for
less, I'll hook up a solid state amplifier. But it's not as much fun as
it doesn't whine when you key your radio. Sometimes it's not about what

is best, it's about what you do for the fun of it...

:> : The solution was to add a relay to break the path to the converter when the
:> : unit was not keyed.
:>
:> It's not a required solution... it's an after the fact mod you came up
:> with because you don't know what your doing here...

: What was the better solution?

I would have replaced the transistors with NOS or surplus units. I just
did a Sonar last night for the same problem you describe. Not rocket
science and the Sonar also lacks any large hunk of heat sinks in place for
long duty cycle operations.

: With the relay solution, the customer could put the same amp back into the same
: place in his mobile and run it exactly the same way he did before and never have
: it 'melt down' again.

A good set of transistors as installed should do the same thing, less the
holes and cost of a relay you don't need.

:> What do you throw out as a
:> good icas amplifier, made that period of time in a similar price / clase
:> range..?

: The HYGAIN amplifiers.

They are nice amplifiers, but they do reduce their tube lives much quicker
than many amplifiers. They are not ICAS amplifers and will melt down under
long keydown conditions. They have a very similar inverter circuit.

:> I have two Sonars in for repair right now, I've reversed engineered the
:> circuit and the Kris is a very similar design. Almost all the problems
:> I've ever repaired with these type of classic designs have been operator
:> caused. The BR-21 on my bench right now has failed transistors and
:> more...

: Why bother?

Because some people enjoy operating old equipment, myself included. I
prefer to leave larger/fast amplifiers on the shelf and operate for the
fun, that's what radio is about.

: The Germanium power transistors for the DC to DC converter plus the high price
: of replacement tubes would cost much more than some of the new solid state RF
: amplifier transistors, (like the 2SC2879's) and a pair of them will put out a
: lot more power with more efficiency than that old tube amp ever will.

I get them surplus for free or cheap... Forget your crappy 2SC2879's...
If your going to blow your own horn, try some fets instead.

:> When you have some facts, a lot more background, more education and a
:> little less ego... feel free to chime in with your then more informed and
:> hopefully qualified opinions. Right now your not doing so well...

: That last paragraph sounds like you are feeding YOUR ego!

But I supply the facts and supporting evidence here, not just throwing out slams against equipment without knowing the circuit in detail.

: My ego is doing just fine thank you, so I don't feel a need to resort
: to any derogatory verbiage here.

Your getting better... at least no personal slams made it out this time D. I'm impressed with that part. My ego is in check for the moment, just don't trash an amplifier close to my heart unless your willing to debate the issues.

cheers

Hey Gary, are we to assume that linear amps are fine - but not unless you speak English?

Mike, I hate to break the new to you, but folks that speak foreign languages (foreign to you and me, that is) can also purchase export radios (hmm .. they are for export, right?) as well as linears. By the way, I served in Vietnam and WOW! You should have seen all the foreigners! Same thing when I visited Hong Kong, the Phillipeans, etc. etc. ... I think you get the idea. We are but a small part of the globe. Those amps sure to make it seem smaller, right?

A silly post. They shut the phone off in our department for outgoing calls (too many folks using it for personal business). Yeah, a bunch of folks are using cell phones. This is why I carry my 440 HT to work. Punch a couple of buttons and I have no problem making any phone calls. I also manage to find interesting conversations - like the one a couple of weeks ago with a professor who teaches theoretical physics at the University of Rochester. So, how do you use your communications capability?

Yeah yeah I know, har-dee-har-har. I have been all over the globe, as well as lived in southern europe for a couple of years - so I've seen foreigners also, and seeing is believing - they DO exist. :) What I don't believe is that 98% of the world's linear-owning popluation is spanish speaking. The fact that on channels 1-40 on my radio I get nothing but people speaking spanish in south-western PENNSYLVANIA seemed a LITTLE strange to me, that's all. Add in the fact that every one of them TACKS the db meter.... well I thought I lived in a mostly english speaking community. I've been trying to find someone around here within 20 miles that speaks fluent spanish so I can practice with them - but haven't found a single one. Turn on my CB, though, and all of them "come out of the woodwork" and start speaking perfect, native, fluent spanish.

I was just wondering if there was another explanation besides "rogue central-pennsylvanian spanish-speakers who conspire to jam channels 1-40 on the 11 meter band after 7pm", or "everyone in mexico owns a 2-kilowatt linear amplifier and conspires to jam channels 1-40 on the 11 meter band after 7pm". If there isn't another explanation, well, I don't think this whole situation is common knowledge - and maybe the National Enquirer would be interested in the story.

Doc,
Are there areas on the vehicle that has an electrically better ground than
others or is that just another myth?
For example, someone told me that they have this analyzer that costs in the
thousands and it is made to find the best grounding point on the vehicle.
True? False?

Wet your index finger and then stick your tongue on the positive terminal your car battery. Wherever on the car's chassis hurts the most when you touch it with your wet index finger is the best ground. The thousands of dollars are the hospital bills.

Cant say I ever heard the story. Both sides used the 25-30 range for tanks and jeeps, we used a lot of FM. But in 1942, our radio gear was largely crap.

Realize that 30 MHz was the upper limit of operation for most tubes of the vintage and the front-ends of most receivers were pretty useless much above 20. Q-Street at the time had a section called On the Ultra Highs that dealt largely with ten meters. The radar you see at Pearl Harbor ran somewhere close to the 2 meter band; some pre-war British television equipment was pressed into service to jam German bomber-guidance beams.

What makes the story ring true is what every SW broadcaster knows: it takes less power to cover an area as frequency goes up and you get more coverage for the same power as frequency goes up. This is why shortwave changes schedules and freqs twice a year (just did Sunday) along with daylite time.

The alltime winner for spot cycles was the 1958-59 monster in which MUF on a lot of paths made it as high as 70 MHz. Since then they have been your basic wet firecracker with occasional spitting and sputtering. There is some evidence that the spots also have a 6-800 year or so cycle on top of the 22 year main cycle with the 11 year activity in alternate solar hemispheres. We just had a sputter BTW which may be part of it.

Enjoy the band. Anything can happen if you wait long enough.

Dick

Want to talk DX? then ground the chassis, it's funny, the ch. 6 super stars are no doubt the best skip shooters in the country, Ask any of them if they ground the chassis! I talk skip almost everyday and I have never heard most of these ducks, muchless hear them get their name called. I'm sure there will be a lot of posts contrary to what I am telling you, but just go to the bowl and listen... then buy some grounding cable...10-4

Ok Mike and Morpaholic - just had to give ya a lil tweak! Seriously, if the MUF gets a bit low so the skip is out, it will often support skip towards the South. Although there is transequatorial propogation, my guess (and it is a guess) is that the ionosphere will be ionized a bit more as you get closer to the equator. This would mean that skip might be out to Europe (or in East - West directions across the US), but the MUF in a direction towards the south might be enough higher to support the skip. Just a guess, but that would mean that Mexico might come in fine (even with the stock CB radios), while Canada would be quiet (MUF below 27 MHz). That ok?

73 from Rochester,
Jim

ps - for what it is worth, my coworker was experiencing the exact same thing last year - tons of Spanish. This might also be from some more local areas with a large Spanish speaking population. Sorry, but I just couldn't resist that tweak earlier! Have a gooder, guys!

Radio Equipment Sale

Albrecht AE-485S 26.000 / 30.000 Mhz All mode HF trans --- ï¿½140.00
This radio is as new and under 10 weeks old. SOLD

Zetagi B300P 200/400 Watts All mode amplifier --- ï¿½50.00

Mass KM 2500 Echo/PWR Microphone (600Ohm) --- ï¿½25.00
This Microphone is new in the box RRP ï¿½49.95.

Y-Quad Antenna 2 Element + Rotator
Horizontal/Vertical Polarisation 26.000/30.000Mhz --- ï¿½80.00
14Dbi Gain (4 foot Boom) U.S.A Imported.

3 Element Beam (spitfire)
--- ï¿½20.00
Beta Matched.

Emperor TS5010 26.000 / 30.000 Mhz All mode HF trans --- ï¿½140.00
This radio is like new and under 12 months old. SOLD

President Jackson 26.065 - 28.000 Mhz All mode trans --- ï¿½100.00
Very nice condition works very well. SOLD

Rotel RVC230 80ch radio
--- ï¿½35.00
UK/Cept freq.

RMS 301 Swr/pwr Meter
--- ï¿½15.00
Pwr to 1.5Kw readout vgc conditon.

Alinco DJX-10 comms receiver all mode --- ï¿½140.00
Boxed as new 100Khz - 1999.9Mhz hand held.SOLD SUBJECT TO PICK UP

Realistic Pro2042 Scanner Receiver ---
ï¿½140.00
25Mhz - 1.300Mhz Fm/Wfm/Am mode 1000ch.

All Enq to e-mail or phone Steve On 07747836193 or Simon On 07950287599

Thats great Gary, My Gig went well also, I made 5 illegal contacts on the Super Bowl, from the mobile I dusted of the 3-500z's got the filaments nice and cherry red, It was pure heaven as I felt the RF heat the back of my neck. And Not a G-Man in site. Its kinda like taking candy from a open store nothing to worry about, hey mate.

So far the only mistakes I'm sure I made were:

1) The use of the term avalanche mode instead of Thermal Runaway, and

2) Starting to debate this issue with you.

I believe that statement applies equally to BOTH OF US!

> One would assume any installed transistor would have very little or no
> significant leakage current.

That would make an ASS out of the person making the ASSumption.

> It wouldn't matter if it were Ge or Si type,

Sure it does.

The leakage currents in the Silicon doping do not increase at the same rate
that the leakage currents in Germanium parts do.

What is YOUR explanation for the demise of the Germanium transistor?

> both types will try to run away in excessive heat conditions.

The silicon does not run away as quickly.

> You make the
> use of Ge power transistors in a circuit sound like a crime... it's not.

Then why are there no new designs using them, and why did all the manufacturers
all stop producing them?

> you'll find the power transistors have a xmfr winding in series with each
> device.

When the effect of the series parts is negligible relative to the condition
being considered, they can be omitted.

The .002 ohm DC resistance of the transformer winding can be considered as
having a negligible effect on the one or 2 amp leakage currents and their
resultant 10 to 20 amp collector currents.

20 amps X .002 ohms is only .04 volts.

Even if the transformer was highly in-efficient and had a primary resistance 10
time higher, the DC drop would still be less than half a volt, so it's effect is
negligible and the devices can be considered BRIDGED for any DC analysis. And
leakage current on standby is a DC analysis.

> AC source/chopper. When your trying to nail down an issue, you need to be
> specific.

I was extremely specific.

I'm not even going to shoot you down for the use of the terms 'modified AC source/chopper' because the context of what you were trying to say came through fine even if the terminology you used was not the most correct.

If the AC output is not used for anything but the input to the rectifier, the unit is a converter, not an inverter.

If the AC output was used for something else, you could call it an inverter.

It's simply a matter of definitions.

I didn't make them, so please don't blame me for them.

> comparing it to an Alpha or similar quality amplifier. Remember the price
> range and type of amplifier it is/was designed to be. It fits the
> original requirement(s) quite nicely.

My broad statement was related to my personal; experiences with them.

I may have repaired 50 or more units over the course of the last 30 years, and in almost every case there were no other signs of misuse, and the amplifiers were WORKING FINE when their owners shut them off.

They discovered the blown fuses when they tried to use them the next day and they would not turn on.

That's why they did not believe that one or more of the converter transistors were blown out.

Adding the extra relay, or in some cases just permanently connecting the feedback system and using that already existing relay contact to switch DC to the converter, solved the problem.

Now they could turn the unit off while it was still working, no matter how hot it was, and the leakage path was broken, so the transistors could cool instead of going into thermal runaway.

> :> The power transistors on the rear pannel are not door knob style.
> : That may be true, it's been a long time since I worked on one.
>
> It shows...

Actually, I did check some old Kris 300M chassis that I had junked out for parts, and they DID have doorknob style transistors in them.

To make sure I did not have some special or custom modified chassis I dug out the old factory manual on them and the factory specified converter transistor was a 2N4048, which was a 60 amp Germanium transistor in a TO-36 case, which is commonly called the DOORKNOB style case.

They were NOT the TO-3 cased parts as you had insisted, and my memory was NOT wrong on that issue.

But that should NOT have been an issue at all!

And you should not have made it into such a big issue!

The issue was Germanium leakage problems and the extremely small amount of heatsink surface area on that amp., not the size and/or style of the transistor cases.

> : They may have been TO-3 cased parts, but they were Germanium as the
> : semiconductor material, and that was the problem.
>
> Again you mention Ge Transistors as a problem, you really need to go
> back to the books and study more.

I feel fairly secure in my understanding of the problem.

> The use of Ge transistors is not a
> problem in power supplies it's been done hundredes of thousands of times
> in the past.

But they are NOT used in any new designs because better parts are available that do not have the thermal problems that Germanium has.

> It's not as common these days, but Si transistor in similar
> circuits is also going down in favor of fets and other newer devices.

The circuits are quite different because FETS are voltage operated devices and Bipolar Transistors are current operated devices, but I'm sure you already knew that.......

> You've got to know your old technology along with your new devices Dennis.

I'm an old guy so I am pretty secure with old technology, and I am trying to keep up with the new stuff as it becomes available, like the new ORGANIC transistors I am playing with now and the optical switchers that move tiny little mirrors inside a chip to redirect (switch) optical data links without converting them to electrical energy first.

True.

I didn't deny that.

I just never ran into any other amp that would blow itself up AFTER it was
turned off!

> :> check the paperwork

> status.

I did, and I found that the pass transistors are NOT Germanium.

Put in a Germanium part, get it hot, and see what happens.

> : Therefore the leakage current path continued to exist at all times, and
> : if the transistors had a high enough current gain the oscillator
> : actually continued to oscillate at a low level.
>
> Boy, you really are out there Dennis... and completely wrong.

How can you say that without having been there?

Why don't you run your Kris 300M until it get's hot; say 60 or 70 degrees C at
the heatsink, and then put a scope on the oscillator......

I'd say there as about a 25% chance that you will see those low level
oscillations yourself.

> If I had
> any transistor with a substantial leakage current, I'd call it bad and
> change it out. The classic power transistors often have very low current
> gain (>30).

The 2N4048 had a guaranteed higher current gain than that, and the upper gain
limit could go as high as 150.

When the gain hit 150 or more they were selected and numbered as a 2N4051 or
2N4052.

> : The Plate voltage would drop to about 60 VDC because any voltage higher than

More like 20 instead of one.

> So don't shoot the design down unless your qualified to
> make statements which can be supported and reproduced many times.

How may times are necessary?

Out of maybe 50 repairs, at least 40 of them had the problem.

The symptoms were extremely unique.

Owner would shut off a working unit and the next time he tried to turn it on it
would not turn on because the fuse was blown!

You couldn't miss that symptom unless your head was somewhere it shouldn't be!

> :> : Once that amplifier case got hot enough the process would continue in

Here we go again with the 'nitpicking' which has no relevance whatsoever.

For your information there are many different types of DIODES that also work in
the avalanche mode.

Can you name at least 2 of them?

In any case, that is an irrelevant tangent.

> Other devices not
> designed for said can be operated in avalance mode if proper
> considerations are given.

Like current limited breakdown?

> : transistors melted down and turned from semiconductors into excellent
> : conductors.
>
> Then it was time for new transistors, the fuse saved the operator from a
> potential fire.

But it did not save the power transistor(s) from self-destructing due to thermal runaway.

Once again the symptom was that the unit was working when the operator shut it off.

And the next day it would not turn on due to a blown fuse.

The replacement fuse would blow immediately even if the amp was turned off.

> : I believe the inline fuse for that amp was at least a 20 ampere unit.
>
> : With a battery voltage of 13.8VDC and with 20 amperes of current (the holding

> : 276 watts from leakage current WITHOUT blowing the fuse.
>
> Whoa...! big numbers you throw out there. Actually, kris sent out the
> amplifier with a 30 amp fuse in the protection position.

I said AT LEAST a 20 amp., (to give you the benefit of the doubt), a 30 amp fuse would only make the condition worse because now the transistors could dissipate over 400 watts without the fuse blowing.

> It should operate
> with about half that amount, 20 amps should be enough... I'll have to
> measure it again.

But the 30 amp fuse should 'hold' at 30 amperes without blowing, correct?

> Again, If you have any significant leakage current in a static/idle
> (receive mode) state, the power transistors should be considered bad and
> replaced.

I have replaced them with brand new Motorola devices and still had customers bring them back for the same reason (and with the same symptom) until I started switching the DC path to the transistors.

> A bad transistor is a bad transistor... Here's a hint... I
> often steal them out of really old Motorola tube two-way radios... the
> "T-Power" line had great replacement transistors which drop right in...

I have done that too, but it did not make any difference with those amps..

> : So it WAS possible for the transistors to exceed their power dissipation
> : ratings without blowing the fuse if their leakage currents were high enough.
>
> If they had significant leakage, they were bad before you started down
> the road with amplifier on...

At that time I had an RCA transistor tester which measured the leakage currents, and at room temperature the devices I installed met or beat the factory specs..

I still have that tester, a model 502 I believe, but I don't use it for much anymore.

Whatever!

I provided the newsgroup with information about MY experiences with that amp..

They can make up their own minds now that they have read about my experiences and about your experiences with the same amp...

> : It is very common for cars to be designed using 4 wheels, but there is

> can and will be different.

I was using the extra contact or the feedback contact, or I would parallel BOTH
if they were available, to switch the current to the DC to,DC converter.

That way I did not have to install another relay.

I could not do that in all the amps because some had smaller relay contacts in
them, but I would say that in about 25% of the amps I was able to do that and it
worked just fine.

There may have been some small power loss due to the relay contact resistance,
but not enough to notice.

I did that, and it did not fix the problem.

> I just
> did a Sonar last night for the same problem you describe.

Did it blow itself up AFTER the owner turned it off?

> Not rocket
> science and the Sonar also lacks any large hunk of heat sinks in place for
> long duty cycle operations.

I agree, but when I was repairing BR-2906's, I know for a fact that there was a
separate relay (K2) in series with the converter circuit because I had to
replace a few.

I'm not sure about the BR-21's.

> : With the relay solution, the customer could put the same amp back into the same

> A good set of transistors as installed should do the same thing,

It should have, but it didn't!

> less the
> holes and cost of a relay you don't need.

There were times when I was able to use the existing relay to make the change.

But you are right in that there were times when I had to add an additional
relay to the amp..

> :> What do you throw out as a

Why? The amplifier HEAD unit is identical in design to the Kris and the Sonar
amps..

> They are not ICAS amplifers and will melt down under
> long keydown conditions.

So you are saying that they had shorter keydown times than then Kris?

What do you use as the definition of ICAS?

> They have a very similar inverter circuit.

They had much more heatsink area per watt than the Kris had, so I never had any self destruct AFTER their owners had turned them off.

Initially they had a similar inverter circuit (in the 400 series amps), but by the time they were building the 600 series amps (the FOOT LOCKER AMPS) they had upgraded the design to use a large relay to switch the DC path to the inverter.

I could have named many others, like Astro, Apollo, ABC, Black Cat, Contex, D&A, Kicker, Layfayette, Lincoln, Tranzel, Maco, Palomar, SOS, Varmint, etc.., who ALL switched the DC power to the switching transistors in the DC to DC converter circuit, but I did not mention them because they were not FCC type accepted.

The boatanchor FTP site has a lot of scans from Johnson manuals, you
can probably check there. You might even find the model that uses the
807's.

There's this wacky-ass on channel 6 all the time calling himself "the man with the plan". He's always bragging about skipping and his amps.

You think the only reason the guys on the bowl are talking is because they ground there vehicles... BB whips everyone's ass and doesn't ground his vehicle So what does that tell you .?

THANK YOU G SEVEN *SIGH*
I have been getting really pissed off at all these morons saying " Oh yeah this is cool I got me a new 2000 and it is so much better than anything you have, even better than my 148" or whatever. Are they stupid? The 148,142,2000 are virtually the same radios, all great and all the same PERIOD
So to all you ignorant babies that suck on a golden screw driver rather than a pacifier. Maybe you should do some research some time

One thing I always loved is called pinning coax and it is sooooooooooooooo fun see what you do is track this person down like these other gentlemen have been explaining then when you get to his house try to get to his coax find a hidden spot (if possible) and literally stick a safety pin thru the coax, you may want to do this more than once just to make sure it was done right. If this sounds funny to ya let me explain why and how it works: When you push the pin thru the coax it connects the shield with the plain of the coax as I'm sure you know that's never good. The second part of this works right off of his stupidity (that's why I like it so much) Most people who do this sort of thing either aren't keeping a close eye on there swr, aren't even in the room, or don't know any better. So when you pin it his swr will go thru the roof and within no time his radio will smoke and you wont hear him for a long time. Not to mentione the fact that you cost him money too and that's ALWAYS nice :)

Just make sure your positive its him I would feel bad doing this to someone and then finding out its not the right guy
have fun
BC
PS the relly good part about this is if he does suspect anything he may go out side and look at everything and most likely wont see the pin hehe

I found two different IP's from Finland:

Name: mutteri.kpo.fi
Address: 212.116.32.226

Name: lyyh07.kajaani.fi
Address: 195.236.21.43

The second matches his NG postings.

That's exactly what I was thinking "why would he want to know if it works when its detached? shouldn't all of them not work when detached?) besides why would he do that when there are tons of radios out there without detachable faces that are probably better
Just plain stupidity I guess

To: Lucent Human Resources
April 2, 2001

Dear Sirs,

I thought you might be interested to know that one of your employees, Mr. Dennis Ostrowski is using Lucent internet resources to post design information on illegal power amplifiers for use in the Citizens Band (see attached files). As you may know, these devices are illegal for use. However Mr. Ostrowski continues with his practice of openly advocating and promoting use of these devices on the Citizens Band. I understand you have had problems with this individual before. I hope you can persuade him of the seriousness of FCC regulations.

Sincerely
xxxxx xxxxxxx

Nah, I didn't run spellcheck on it, and I really don't care that you cannot write even one sentence correctly. Actually, it's not the spelling that kills you. It's your total lack of respect for punctuation. On the upside though, I really like your creative use of the asterisk symbol.

You are a piker. The right way to pin coax is to use two straight pins separated by a quarter-wave times the velocity factor of the coax. The SWR is 1:1, the receiver works good, but he cannot transmit out of his back yard. If he runs power, it is interesting to see the coax after it blows up like a wiener in a microwave.

Not idiotic hearsay:

On my persoanl travels to Mexico and points South of the Rio Grande,
some CB Freqs are used by local police and ambulance. In Belize,
some "Freeband" areas are used by local taxi cos for dispatch.

In Africa (sub-sahara), European style FM stuff is all the rage but
the local Posts and Telecommunications boys & girls keep a sharp eye
out for anything unusual since in dictatorships, communication is the
key to holding power.

are the so-called "export" radios that cover 25-32MHz legal
> for use in by unlicensed individuals?

Licences (note British spelling) is a touchy subject in some localities
and our American style CB type operations would get you in plenty of
hot water, hamming is frowned upon too!

Where (what country) are competition CB

Yeah, you can take the trouble to do all this, and if caught, you
might get shot, or arrested (depending on the owner of the
property).

One incident I heard of down here involved a rather nasty character
in north phoenix. His bad luck was that his antenna (A quad beam) was
located about 25 feet from some heavy mains (powerlines of 7500 volts or
higher).

well, the incident pretty much shaped up like so:
person A tracked down the offending operator and decided punative
action was required to remove offending operator from the air as
expediently as possible. This person removed from his vehicle
a recurve bow, mounted an arrow with #30 copper wire tied to
the rear of the arrow. Shot said arrow and about 50 feet of trailing
wire through the beam and into the hi-voltage powerlines behind
the house. The resulting arc-over removed offending operator from
the air in quickorder, damaging the beam antenna, smoking the coax
and destroying the cb radio set.

The above incident happened in 1982 right here in north phoenix.
I don't know who the person was with the bow, but I do know that
the operator of the cb station creating the problem never returned
to the air after that time.

The details were reported over channel 12 (the local hangout for the
popular cb'er) and much was discussed regarding the problem.

needless to say, it was very effective. However, like pinning the coax,
could get you shot or arrested (n the latter case, you might get charged
with brandishing a weapon and using same within city limits in an unsafe
manner).

The XFORCEs are assembled better. The XFORCES have a better biasing circuit. The XFORCES have better tuning specs on the input and output. The XFORCES use a much better relay. That is why XFORCES cost more than DAVES!!!!! For the extra money you get so much more.Buy A Xforce you will be Glad! Your Super in the Bayou got down!

Thanks for the request on how to read rec-radio-cb. I'll check your replies very carefully, and if you're okay, I'll let you in the "secret". With more and more legal guys reading their messages, we'll see who has the highest cards.
Scotty and his pals will have to figure out a way to shut everybody up - maybe they'll have to start using a CB radio for their contacts - their main interest now seems to be something quite different, I've noticed.
This IP is one of the many at my use, so Scotty can check it out if he has nothing else to do, right?

Gary, oh8mfh
friend of legal radio

Dear Twistedhed,

I was amazed to find a message from you that you must've sent via Googles or something, since I cannot see it here at one of the other computers. The msg was titled "Kari's dilemma" - congratulations; you've used a new word!

In the msg you quoted a text taken from the net, and you evidently are not familiar with amateur callsigns, or maybe you are even more illiterate than I thought, since you claimed that the article about the SAREX project was written by me, Kari, ***oh8mfh***, in ***Kajaani***, Finland.

I must disappoint you: it was written by another ham, ***oh8uv****, whom I do not know too well, but I know that his QTH is ***Paltamo***; Finland, and he works for the school that was mentioned in the article. He is a music teacher and thus managed to write English that didn't pass your evidently high criteria.

Next time you write something about me, please make sure that you use facts, nothing else.

The Last Parachute

An airplane was about to crash, and there were 5
passengers left, but only 4 parachutes. The first passenger,
George W. Bush said, "I am President of the United
States, and I have a great responsibility, being the leader of
nearly 300 million people, and a superpower, etc." I am
also the smartest president ever. So he takes the first
parachute, and jumps out of the plane.

The second passenger, said, I'm Antoine Walker,
one of the best NBA Basketball players, and the Boston
Celtics need me, so I can't afford to die." So he takes the
second parachute, and leaves the plane.

The third passenger, Hillary Clinton, said "I am
the wife of the former President of the United States, I
am New York's Senator, and I am the smartest woman in the world."
So she takes the third parachute and exits the plane.

The fourth passenger, an Old man, says to the fifth passenger, a 10
year old boy scout, "I am old and frail and I don't have many years left,
so as a Christian gesture and a good deed, I will sacrifice my life and
let you have the last parachute.

The boy scout said, "It's okay, there's a parachute left for you.
The world's smartest president just took my backpack."

I just got a Uniden Grant XL, it has a button on the side thats labled A,B,C,D,E,F it has been modified to pick up other freqs. Could someone tell me where I might find a freq read out for this radio and could someone tell me what the high, low switch is for? On some channels when I switch it from high to low it seems to go to another channel. Thanks for any help.....

2934. Interesting QST article

Newsgroup: rec.radio.cb
Date: 2001-04-03 12:50:57 UTC
From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <tcjhof9aiv0198@corp.supernews.com>
Source record: 77558

There is an interesting article about the FCC's new DF stations in the April issue of QST starting on page 28. Seems like they busted several Freebanders, several High Power CB stations, and a few idiot Hams using the new equipment already. For the amplifier users and pirate CB operators on the news group it should be of interest.

The radio appears to be modified with extra channels, the hi-lo switch probably gives control
over a 40up-40down expansion board and the rotary switch enables selection on 6 different
bands.
You really need a frequency counter to determine the correct operation of the radio.

TUBES AVAILABLE

I currently have over 300,000 tubes in stock. Have a good selection of both new and used/tested tubes for audio, CB & HAM radio, TV, CRT use.
Sorry I do not have a Web Site nor a price list. Suggest that you Email or Fax me with the tubes that you are looking for along with the quantify of each needed. I will check my inventory and advise you of current availability and cost.
In addition, I also have a very good selection of tube testers, tube caddies and good used CB equipment. Please contact me regarding your needs.
Thank you for your consideration.

There is a chart at
http://www.geocities.com/CapeCanaveral/Launchpad/8243/cb which might be a
good guess. It will take a frequency counter to be sure. The high/low
switch more than likely gains access to the radio control freqs above
3,7,11,15 and 19. The switch makes it 45 channels, the lettered selector
moves those 45 channels in 450 kHz increments above and below CB.

If C is the regular CB band, then everything above Channel 12 on E and all
of F will fall into the ten meter Amateur Band (including parts where
voice is not legal) and will piss me off mightily.

A couple of things here. When you measure the swr are you clear of
any trees and buildings for at least 25 feet or so? Where are you
mounting the antenna?

2948. Re: Uniden HR2600 w/Chipswitch - NEW MANUAL!!!!

Newsgroup: rec.radio.cb
Date: 2001-04-03 18:50:43 UTC
From: Karl Vesterling <kjv@adelphia.net>
Message-ID: <7Yoy6.5431$l61.1133123@news1.news.adelphia.net>
Source record: 77571
Cross-posted to: rec.radio.swap,rec.radio.cb

Just thought I'd take the time to mention that there is a new Chipswitch manual available. The new one is professionally done (by myself) and is available in Acrobat PDF format. It has easy to read charts and and a clickable index to make it easy to find exactly what you want quickly.

How much is it? $ FREE!

It's available on Doc's site at this URL:
http://kjv.homeip.net/~hr2510/html/chipswitch_information.phtml

The link to it is on the top next to the acrobat logo.

The manual is VERY nice. (Ok, biased opinion, but seriously, I did my best for the price...)

PS: I wish someone would put this in the group FAQ so I wouldn't have to keep telling people about it. (nudge nudge, wink wink... Know what I mean?)

The only thing being sold at the moment is TV channels above 50 (complete with a few TV stations in them) and some spectrum that the telco couldn't pay for. Telcos in general couldn't borrow a dime worldwide.

The Spectrum protection act is sitting in Billy Tauzin's committee awaiting the raising of more campaign funds from the NAB and the self-same telcos. It is an interesting pissing contest but not one likely to have too huge an effect on Amateur allocations and for many years at that.

Don't include me in your little battle-group. I speak for myself in
all matters. I may be an opponent of illegal operation, but I am a
much stronger opponent of this escalating stupidity.

The radicals on both sides of this argument have gotten way out of
hand. Both sides should just stop for a minute and see where the
hatred lies. It has nothing to do with illegal operation - that has
only been the polarizing influence. The real issue is the constant
insults, name-calling, threats, flames, etc. Both sides like to dish
it out but neither side is willing to take it. This is rec.radio.cb,
not alt.flame.war. If you want to organize your troops, fine. Just
fight your battle somewhere else because your cause sure as hell has
nothing to do with CB radio.

"Mr. Waterbug",
That's not really very much of a change at all, and
could be caused by a numebr of things. Off hand, I'd say
that the grounding didn't make any difference in your SWR,
but I wouldn't expect it too. The 'proof' would be if you
noticed any reduction in noise from what you had before...

Readings of SWR will vary from day to day, and even hour to hour location of vehicle near other objects but as long as the "skin" of the vehicle is grounded it doesn't matter to rf if your muffler is grounded to your frame, and the engine block grounded to that or your axles, bumpers, are grounded, you radiator etc If that was the case why not carry around an anchor so you have more metal to ground to. The body of the vehicle is what needs to be grounded together the trunk lid, to the roof, to the hood, do you think it matters to rf what under the hood is grounded, do you think rf goes through the body of the car, and radiates off of the frame .. NO I don't think so. But hey what the hell do I know.

Can I ask for a clarification? As I understand it, the FCC rules DO carry the weight of law passed by Congress. It is law that created FCC and empowered it to enforce/regulate said rules. Therefore, would inot be the same as law?

Jerry

BadaBing and Jay,
I will agree with you on Dennis and his contributions to the NG,
however all the emails and letters to his conduct may not weigh to
well with senior management who answer to stockholders when they ask
the question of his postings on the newsgroup while on the clock.
Remember in this world the bottom line is performance and performance
equals money.
If a company finds the you are not performing to meet that bottom
line then they WILL replace you there stockholders will demand it or
they too become expendable. I wish Dennis well but hope he will not
post here while on his companies time or equipment.

Whats the "best" base station coax available?
Ive heard of this stuff called "hardline", is it that good? Supposedly it's real spendy.
rg8u foam brags of.85db @ 100 ft. with a velocity factor of .80
and it's readly available.
also some stuff called 214 or 2214???
Any help would be greatly appreciated as I am setting up a base station for the first time in 28 years.
Thanks
Paul

Twistie, you are SO funny when you get all frazzled. Guess it must be a REAL shaker-upper to know you're on the losing side, huh? So go ahead, replace all the chipsets and bamboozle all the dumb CBers you want with your illegal "tech" service. Nobody cares about your little outlaw business, except maybe the FCC in days to come...

Yep, I admit: all those years of listening to pirates on ham bands have made me a bit intolerant towards them. On the other hand, I'll try to make their openly criminal activities at least a bit harder - I do not think they represent the ideal customer to many companies like Yahoo or Hotmail.

Gary,

You must forgive poor "twistedhed". He does not understand ham radio
callsigns. His experience is limited to the rather rural environment of a
backwater Florida town where the most sophisticated radio he's ever seen was
a Browning Eagle with a butchered Siltronix VFO added. How could he know
about other bands, other countries, and other modes? You are talking about a
man that thinks SAREX is a laxative and IARU is a new pancake restaurant.

Oh, but what he *does* know about are UFO's, since he imagines that Venusians
take him for rides at night and touch his private parts (which he enjoys).
Naturally, it takes a lot of corn liquor guzzling before they show up, but
they always do, most every night of the week.

What would be instructive is if he made a trip to Dayton, Ohio for the big ham
convention. If he acted real nice I bet some licensed hams might let him ask
questions about international amateur prefixes. Chances are though, some ham
might hock a big, juicy lunger in his face and spoil the whole trip for the

poor guy.

No, it might be best if he sent his personal suck-up and butt-boy, Moparholic to Dayton. "Mope The Dope" could take notes and report back to his boss Twisty. Then he and Twisty could discuss it with the Venusians that night over a can of Crisco and some amyl nitrate poppers.

Anyhow Gary, I wouldn't waste time trying to convince him you aren't some other Finnish ham because the man has a warped sense of reality to begin with. He actually thinks there are ONLY three people in this NG that enjoy baiting him.

HAHAHAHAHAHAH!!!!!

It depends. If you are running legal, almost anything will do, but
RG-8 is recommended. If you are running power in excess of a few
hundred watts, you will want something more robust. And whatever you
run, DON'T USE FOAM!!!

Awrite, man, thanks for the kind words. What I didn't realize was that you can see messages in rec.radio.cb thru various places like the news. Kolumbus.fi I use here and thru Google's newsgroups. Please read some of the stuff Twisted writes there, and also, please note the comments that he gets from one of my countrymen. I was truly amazed, I think this calls for a little action also from my part. The address is www.google.com and go thru rec.radio.cb newsgroup.

73 to you, Gary

The 'ideal customer' for Yahoo or Hotmail is only for them to decide.
If you are becoming intolerant, the chances are the they are too. If
this ng is any indication, then this is true. But didn't your momma
teach you how to act like an adult when nobody else does?

Curb it.

The problem is different on our sides of the pond but this is one illustration of what happens when people play. This guy had the good sense to ask for which he should be congratulated. As you notice from other posts, these rigs serve as the local cellphone in a good part of South and Central America. The Channel 9 emergency channel became many years ago the link between the Eastern US and Puerto Rico; it is still more than likely a favored link for drug traffic.

As it happens, I live on the main East-West corridor of the United States; Omaha was the eastern terminus of both the Union Pacific Railroad and earlier the Western Union Telegraph Company. A lot of Mormons froze in Florence which is now north Omaha going west and the Oregon Trail follows the south bank of the Platte River not too far west of Omaha. So what is now Interstate Highway 80 has a long history and an equally long line of trucks. As is true in the marine service as well, everyone is looking for the 'quiet channel', the 'company channel' or at the very least some freedom from bozos. (FYI Bozo the Clown was a fixture on morning TV when most of us were kids). I can hear them on 28.085 -- Channel 19 up two on rigs like the Grant -- on a lot of days. These guys don't have a clue where they are or why. In a lot of ways I can see their point.

Without wanting to start a gun control debate, national mythologies are always interesting. The Oregon Trail and sturdy pioneers forging their way West against natural barriers (quite real) and attacks by savages (unreal) are part of ours. In reality, any point on the Oregon Trail only had traffic about six weeks out of the year, the wagons were rarely out of sight of each other, unless one was stupid enough to put his whiskey barrels on the outside the Indians couldn't care less, and the largest cause of death was gunshot wounds. Some of the wounds were self-inflicted (would a mentally stable individual load up and go??) but most were the

result of the fellow in the next wagon leaving his ancient flintlock cocked, hitting a bump, and shooting the poor guy ahead of him in the back. As the military found on several occasions and every deer camp owner knows, their clients couldn't hit a bull in the ass with a base-fiddle let alone a target with a rifle.

Now living 200 clicks from the Russian border has to be insecurity at its highest. Bet it has raised bribery and black marketing to fine art orms -- assuming, of course, there is anything left in Russia that hasn't already been sold.

Dick

A radio is a Visa card away, but watching a guy with an swr fetish -- and it is rampant on 27 MHz -- try to figure it out is priceless. You just have to cut the pins flush. The same guy that has an SWR bridge that cost more than your rig may not even own a simple VOM.

Vandalism lacks class anyway.

Sparky, please read his msg in rec.radio.cb, called Re: Tistedhed in Googles rec.radio.cb dated 2001-04-03 06:16:06 PST.

He uses a Finnish ham (oh8uv) to make me look like a fool. What he doesn't know is that Markku, oh8uv has never ever thought kindly of illegal pirates, we have chased them away from ham freqs in the past. Also, he doesn't know that the above-mentioned ham is in personal trouble, which of course doesn't belong to this newsgroup! He doesn't understand that Twisted quoted him in his message, either.
Here's a direct quote from Twisted's msg, called "Kari's dilemma" in the same ng, dated 2001-04-02 07:16:11 PST:
"Below is an excerpt that was an attempt at translation to English by Kari.
The poor fellow you snowed into thinking that you know what you are doing was emailed and invited to partake of your 'helpful' posts to the ng and made aware of what really is going on. Run along now and do damage control."

I would assume that Twisted regarded the article as written by me, which it isn't, it was written by oh8uv. I pointed it out to him, but he refuses to correct his mistake. I do not wish to speak badly of Markku, oh8uv - he is a ham, an excellent VHF worker, after all, and has had his share of bad luck in life, which nobody here knows of, and will never know, if it's up to me. If he decided to open his heart to Twistehed and his criminal associates, that's his business. Please read my reply to Twistedhed, too.

NO FINNISH HAM could ever approve of what Twisted and his gang are doing in rec-radio-cb, or here. You can, of course doubt my words, but I must leave you with that choice, Sparky.

73, Gary

P.S. Would you lose your temper if you met with such an insult, I wonder?

Of course I don't think that promoting illegal operation is good for
the hobby at all. And I don't doubt your intentions, but I have
concerns about the methods of others. Pissing people off never
accomplished anything positive.

It took one post to make me realize just how far all this has gone. If
you have any respect for my position and my posts, please just allow
some time to cool off. You can be an active opponent of illegal
operators without aggressive behavior, or provoking aggressive
behavior from others - that is not the way to change the minds of
those that are yet undecided. Demonstrate tolerance, respect, and
integrity. You have done so up until now, and I respect that. I just
ask that you don't cross the line.

I may have been premature in this statement, but please take into consideration it's purpose.

Sparky, FLCD

Wwhen al else fails, call names."

Perhaps he chooses to act like an adult. For once.

"This, coming from Sparky, carries only slightly more merit than from
the other one. You are still off the mark."

But what is YOUR problem? Can't you see when you have carried something
too far? Namecalling for the sake of instigating an argument? So what
makes you any better than them?

Sparky, FLCD
Sparky, please read his msg in rec.radio.cb, called Re: Tistedhed in
Googles rec.radio.cb dated 2001-04-03 06:16:06 PST.
He uses a Finnish ham (oh8uv) to make me look like a fool.

"Sorry, Kari. You do that quite well and on your own, I did nothing
except post it. If anything, you should utilize some of that alleged
edjumacashun you GOT and learn to choose who you pick your battles with.
You want to lie and infer stuff that isn't true? Bring it on. I have
nothing but time. You see how I, and others, reduced Dougie to no
credibility at all. You are on the same path."

What he doesn't know is that Markku, oh8uv has never ever thought
kindly of illegal pirates, we have chased them away from ham freqs in
the past. Also, he doesn't know that the above-mentioned ham is in
personal trouble, which of course doesn't belong to this newsgroup!

"Like we are concerned with youir attempted damage control."

He doesn't understand that Twisted quoted him in his message, either.
Here's a direct quote from Twisted's msg, called "Kari's dilemma" in the
same ng, dated 2001-04-02 07:16:11 PST:
        "Below is an excerpt that was an attempt at
translation to English by Kari.
        The poor fellow you snowed into thinking that
you know what you are doing was emailed and invited to partake of your
'helpful' posts to the ng and made aware of what really is going on. Run
along now and do damage control."
I would assume that Twisted regarded the article as written by me, which
it isn't, it was written by oh8uv. I pointed it out to him, but he
refuses to correct his mistake.

"He made up his own mind after reading your posts here.
All I did was invite him to read your trash. Sparky gave you decent
advice. Take it."

I do not wish to speak badly of Markku, oh8uv -
"Then don't."

he is a ham, an excellent VHF worker, after all, and has had his share
of bad luck in life, which nobody here knows of, and will never know, if
it's up to me.

"And this has what to do with anything?"

If he decided to open his heart to Twistehed and his criminal
associates, that's his business.

"No. He opened his mind to see that you and your pink cohort have no
reason to infer anything of the sort based on anything I wrote. Just
another good operator seeing you for what you are...a troll and
troublemaker."

Please read my reply to Twistedhed, too.
NO FINNISH HAM could ever approve of what Twisted and his gang are doing
in rec-radio-cb, or here.

"Talking?"

You can, of course doubt my words,

"Have you not noticed, Kari? Everyone doubts your words now. You shot
your own credibility by posting lies to justify your childish actions."

but I must leave you with that choice, Sparky.

73,
Gary

"How nice of you to give Sparky a choice. This infers he is not capable
of making it on his own. You want to regulate our speech, now Sparky's
choices. How far do you want to go?"

P.S. Would you lose your temper if you met with such an insult, I
wonder?

"What insult? No insult. The only insult was the way you snowed that
poor guy into thinking you knew what you were doing."

Paul,
'Best' is a relative term and depends on what you think
is reasonable. Hardline is not reasonable as far as I'm
conserned (unless it's given to you)! There isn't enough
difference in performance between some kind of hardline
at $3.00 a foot, and RG-213 at maybe $.50 per foot. You
don't want to know what the connectors cost! For the
average CB'er RG-8x or RG-213 is all that's ever needed.
I seriously doubt if you could tell the difference between
RG-213 and hardline. The people on the 'other end' will
never know the difference. It's your pocket-book, so suit
your self...

BadaBing,
If your talking about your transmitted signal, your probably correct. If your talking about you received signal, then yes, grounding all those things you don't think make a difference certainly can make a big difference. They all contribute to the noise level of your received signal.
Since the frame, muffler, tailpipe, etc ~are~ part of the antenna system, yes, they do ratiate. Maybe not much, and I really doubt if you'd ever hear the difference, but they are part of the antenna system, so do matter to some extent. Mass doesn't matter much, but surface area does...

So Doc how does grounding the muffler, tailpipe, etc help you radiate?
How do they effect your recieve? This is not a base station we are talking
about, how in god's green earth Wil that help. Using your twisted logic then
all 18 wheelers should have no noise level. Give us a electrical
theory/answer rather than your opinion
Like Bada bing said does that mean you load up your vehicle with all kinds
of metal. I doubt it The metal of the vehicle are like ground radials on a
omni, they reflect the signal and keep the ground losses to a minimum, how
does grounding your frame help this, Is the rf mysteriously going thru my
roof and reflecting off the frame... Lets have a believeable theory, So far
bada bing I believe your logic.

Ahehehehehehheeeeheheheh! Watch your blood pressure there. Don't want to stroke out and be in that all too familiar uncaring doctor's office of yours before you drag your malignant carcass to the hammie fest where you will no doubt wear your good, stained T shirt that you wash EVERY month whether it needs it or not and offend everyone that happens to be downwind from your already-bursting-at-the-seams pocket protector wearing pre-cardiac implosive, offensive frame. Tell me son, are the numbers a coincidence, or do you just like forging the same ones all the time? Ahahahahah! Thanks for throwing in the towel big guy. Have a great day! :) Oh, yea, lest I forget, catch! (Twisted tosses a dog biscuit, watching, with true astonishment, as it is snatched in mid-air, as the canine cocks it's square head and looks somenly and obediently to it's master, as if to say, yet again, "Thank you sir, may I have another?")

This from a nig like me that never appeared on the radar screen of normal intelligence before, and aint ever likely to, and I am too afraid to quit sucking cock, because I would turn to dogs and horses then, like my mommy and my wife did. I am an ILLEGAL FAGGOT KEYCLOWN and thus have no crediblity, as you genius level anti-keyclown forces already know. You can use my mouth for a semen donation center anytime you want. Don't mean squat. you could lose, but only by laughing yourself to death. and I always will suck cocks. There are three of you for certain who are still verbally whipping me and y'all's dicks are ate up by me. Everytime I make my wife bark bark, you laugh because she is an animal cum encrusted piece of dog shit with a cunt attached!. I act the fool because I am too much of a faggot hunk of human refuse to do anything else. Think I should start calling MYSELF "The PUSSY ASSED FAGGOT? After all, I am one. I am sitting plush, wih a royally semen flushed asshole, with me and 'ole Dweebo's asses crack to crack. My lips are wild and Uncle Chickenhawk's crawling in and outta my sphincter. Now,I cry, "UncleChickenhawk, fuck me harder!!!".

OK, Sparky. Your point well taken; you cool down and I'll cool down. It was just that using another ham against me was a bit below the belt, wouldn't you say?
Please notice that I did NOT bring up the other Finnish callsign, it was Twistedhed. When I say something against the criminal-type of CBers, I have NO intention whatsoever to drag along other hams who have absolutely nothing to do with the issue. If you want the truth to come forward, look me up in the net with my call, and I'll e-mail you. The matter doesn't belong here, as you might guess.

73 to ya, Sparky

..although Twistedhed is by far the WORST. ("so what is it I do?" he whines. How about FREEBAND for starters? How about the fact that you are a total ignorant ass, too?) About 70% of this NG is engaged in illegal CB activity.

*The keydown crowd - they spew KILOWATTS onto the band and think they're CB heroes.

*The mod doctors - they butcher radios so they'll transmit out of band

*The freebanders - they pretend to have invented a rule-free version of ham radio

*The equipment dealers - nasty folks, they'll sell anything illegal for a profit, including cocaine.

Together, these bozos have made rec.radio.cb into a CLUBHOUSE FOR ILLEGAL IDIOTS. All over the usenet the word is spread "if you need something illegal, go to rec.radio.cb". Unscrupilous hams come here to unload messed up amps or questionable 10 meter radios. Pirates come here to mod FRS transceivers for out of band use. It's like a scene from MAD MAX THUNDERDOME.

Is this the kind of NG you really want?????

Think about this when you hear Twistedhed and others spout their nutcase anarchist crap.

Response to ARRL 10 and 12-Meter Intruder Survey "Overwhelming"

ARRL Monitoring System Coordinator Brennan Price, N4QX. [ARRL Photo]

NEWINGTON, CT, Apr 4, 2001--The response to ARRL's call last fall for reports of apparent unlicensed operation on 10 and 12 meters has been "overwhelming," according to Brennan Price, N4QX, administrator of the ARRL Monitoring System. The survey last October 1-14 was initiated in response to an increasing number of complaints from the amateur community. Such reports have increased over the past few years, right in line with increasing solar activity.

"We expected a moderate response, but the volume was overwhelming," said Price, who's been analyzing the reports. "More than 400 separate reports, nearly all from United States amateurs, detailed over 1000 separate instances of apparent unlicensed operation."

An analysis of the languages being spoken indicated that a substantial amount--nearly half--of the apparent transmissions originated in the United States. Most of the remaining reports appeared to document transmissions originating in Latin America, with a small fraction, about 2 percent, originating in Europe.

Reports varied from respondent to respondent. A few gave a specific location of the unlicensed operator. The reporters were queried for additional information, but Price said that in all cases, the operation ceased before efforts to find the station could commence.

"The variety of languages, dialects and beam headings relating to these transmissions clearly indicates that this is a worldwide problem" Price said. Surveys by monitoring-system administrators in other IARU Region 2 countries confirm this conclusion.

Price says the data collected have documented the magnitude of the problem and should help the administrations of IARU sister societies to address the problem. He explained, however, that operation within a given country is a matter that only the telecommunications authority in that country can address.

ARRL shared its data with the FCC. Enforcement Bureau Special Counsel Riley Hollingsworth already had indicated a willingness to take action against domestic unlicensed operators, and the results of the survey have prompted a renewed FCC interest on that front. Price points out that before the Commission can take any action, an offending transmission must be documented and its source found.

"Given the changeable nature of 10 and 12-meter propagation, especially at the top of the sunspot cycle, this is not an easy task," Price said. "Domestic intruders should become less widely heard, but more easily found, as the solar cycle declines and propagation tends to become more localized."

Price said the amateur community also has to realize that the FCC's technological resources are limited. "Although the Commission's HFDF facility is a useful tool and is generously made available to help amateur concerns, it is not available for routine requests to DF this type of operation," he said.

One fact remains indisputable: unlicensed operation declines drastically when licensed operators are in abundance and yielding few clear frequencies. On major contest weekends, unlicensed intruders often are nowhere to be found on 10 meters, Price said. Active usage of the spectrum not only is the quickest, easiest way to discourage unlicensed operation, it is also the best way to defend exclusive amateur allocations against interests that continually seek more room for commercial allocations.

Price said the FCC relies on the Amateur Service to be self-policing and has indicated that it is most likely to act in suspected unlicensed operator situations when amateurs themselves document the cases. "It is not easy or quick work, but it has been successfully done in the past," he said.

To introduce amateurs to the work required, ARRL has published--with FCC review and approval--the article, "Unlicensed Operators on the High HF Bands: What to Do?" (QST Mar 2001, pp 102-103). Since the fall ARRL survey, the FCC has received information regarding instances of unlicensed 10-meter operation. Enforcement letters were expected.

"ARRL appreciates the efforts of all survey respondents who have volunteered their time," Price said in his summary report. "We encourage your continuing efforts to document specific instances of unlicensed operation. We hope that publicity of forthcoming enforcement actions will minimize the problem on the domestic front."

3043. Re: It's Not Just Twistedhed...dammit, yes it is!

Newsgroup: rec.radio.cb
Date: 2001-04-04 22:06:34 UTC
From: twistedhed@webtv.net
Message-ID: <4117-3ACB9AEA-47@storefull-124.iap.bryant.webtv.net>
Source record: 77418

"Awww, test, test, test, test"

although Twistedhed is by far the WORST.

"Waaaaa Twisted this, Twisted that, waaaaawaaaaaawaaaa! Thank you. A badge of honor. One percenter if you will."

("so what is it I do?" he whines.

"Never once asked you that, Dougie. But you guys forge (how many times today?)and cry and curse and cry about speech...talk..nothing more. Get a job, will ya'?"

How about FREEBAND for starters?

"How about freeband WHAT?"

How about the fact that you are a total ignorant ass, too?)

"Call the guy names after he whops ya' in the gray matter and exposes you raw."

About 70% of this NG is engaged in illegal CB activity.

"No activity can take place here besides words. This is a communication medium, not a physical abstract meeting place."

The keydown crowd - they spew KILOWATTS onto the band and think they're CB heroes.

"Which one of the crowd handed you your lips? C'mon, don't be shy."

The mod doctors - they butcher radios so they'll transmit out of band

"Waaaaawaaaaaaa"

The freebanders - they pretend to have invented a rule-free version of ham radio

"Oh. So that is how you see it. And this bothers you why?"

The equipment dealers - nasty folks,

"Translation: The local dealers wouldn't deal with you because you are a troublemaker."

they'll sell anything illegal for a profit, including cocaine.

"They ought to sue your foul mouthed tail off for libel. Remember libel? I taught you the difference between libel and slander long ago and you

waited awhile then outright plagiarized my post and tried taking credit for it, only I wouldn't let you pat yourself on your wide fannie."

Together, these bozos have made rec.radio.cb into a CLUBHOUSE FOR ILLEGAL IDIOTS.

"Nope. You did that single-handedly. And you had a pink cohort or two that joined the fray, only one is now dining tastefully on crow."

All over the usenet the word is spread "if you need something illegal, go to rec.radio.cb".

"Undoubtedly due to the infamy brought by your pornographical posts, lies and phony ads."

Unscrupilous "(sic)" u-n-s-c-r-u-p-u-l-o-u-s

"The foul mouthed porn king poster a self appointed judge of morality. You are a piece ...."

hams come here to unload messed up amps or questionable 10 meter radios.

"Oh NOW the HAMMIES are thine enemy as well. I don't like this one bit. I am the paranoid one here. I demand you stop acting paranoid at once."

Pirates come here to mod FRS transceivers for out of band use.
It's like a scene from MAD MAX THUNDERDOME.

"They had cb in thunderdome?"

Is this the kind of NG you really want?????

"Uh, who is this directed at?"

Think about this when you hear Twistedhed and others spout their nutcase anarchist crap.

"You were the only one to use that word. More fallacies to justify your anti-incubated ego and childish rants."

Gary, What is it of your concern what Bill does. Who has chosen you the NG Police? hmmm I wonder. Your statement is so stupid, you don't live in this country so perhaps you don't understand. we have whats called freedom, and rights It is Bill's right to be a Cber or a Ham or Both at any time he chooses and not have to answer to some foreign ball sniffer from Finland who is just trolling. because we don't answer to Finland,
Finland answers to us. What we do here is our concern not yours, Your rights have nothing to do with my rights. I don't know how it works in your country and I really don't care just the same. You worry about what goes on in your country and we will take care of ours certainly with out the help of you.

Source record: 77421

OK, Sparky. Your point well taken; you cool down and I'll cool down. It was just that using another ham against me was a bit below the belt, wouldn't you say?

"Oh, you want this to go on, eh? You come here and preach your idea of what the airwaves should universally be. I point out how you took advantage of a fellow Finnish hammie in your forum, invite him to have a look at your posts in here, and he saw for himself what you are about. Seems like you want to come here and raise cane but don't want anyone in your home forums pointing out your questionable behavior. You have kind of a hot head to be around kids all day, don't you think? You are supposed to be a role model for those kids, Kari. Are you teaching them your value and beliefs of free discussion, too? What kind of teacher sets examples like this? Your students have access to your posts as well as your homeland hammies. Set an example for them, Kari. Even if you don't agree with what you read here all the time, you don't have to act like you do."

Please notice that I did NOT bring up the other Finnish callsign, it was Twistedhed.

"I posted your scam."

When I say something against the criminal-type of CBers, I have NO intention whatsoever to drag along other hams who have absolutely nothing to do with the issue. If you want the truth to come forward, look me up in the net with my call, and I'll e-mail you.

"Why bother? Email him here at oh8@sral., oh never mind."

The matter doesn't belong here, as you might guess.

"You are right. You guys' dilemma belongs in alt.communism, where you will get no opposing viewpoints. But that would defeat the purpose now, would it not? You see what type person we are dealing with in the foul mouthed loser and forger, Kari. You have to be at least a semi-educated man to be in the position you find yourself in. Is this the type fellow you want to be aligned with in front of the entire world?. Think about it. Remember that semester of Philosophy? Fall back on it and refect. Have a good day."

73

to ya, Sparky

There are a thousand answers, but the reality is this - nothing wrong with ladder line. You needn't be concerned with SWR, just get a good antenna tuner and tune it out. The loss will be possibly lower (possibly much lower) than coax of any description. Hardline is low loss but is is exactly what it says - hard. You don't just lay it around and twist it. Ever laid conduit? The reality is this - if the run is short, it may not save you a couple of tenths of a dB between coax, hardline, or open ladder line. Take your choice and pay your money. Have a ball. (in other words, don't sweat over 1/2 of a dB!)

I don't agree. There's nothing wrong with being part of
two separate radio services.

> Whos has chosen you to be a "technical advisor" in Cb matters, I
> wonder?

Where in my post did you see anything about
me being a "technical advisor?"

> Was the appointment approved of by the ARRL?

See above.

I'm nice enough to archive a good, clean copy of the
original FAQs for this newsgroup. Once a month I
post a pointer to help people find it. That's all there
is to it.

However, being the asshole you are, you decided to
make it into something more than it is. To that I say:
Fuck you, jerk.

Jim. More appropriate is the question "what's YOUR excuse?" I think the answer is that you enjoy a kind of 'quid pro quo' arrangement from this NG.

You get to tell your long-winded stories and act like the Old Salt, and the illegals get treated with deference by an experienced ham operator.

See, the bozos who pump 15 KW onto the band or steal "unused" frequencies want to be respected as "serious radio hobbyists". Nice of YOU to be there for 'em, Jim.

Way to go.

Date: 2001-04-05 01:54:01 UTC
From: Jim Warner <jpwarner1@gte.net>
Message-ID: <01c0bd73$67723300$1dde1b3f@jpwarner>
Source record: 77437

There was also another magazine published in the 70's that
promoted CB. Anybody remeber what it was called? I'd
like to buy a few of each if they're kickin' around.
Thanks,
Jim

Thank you, Sparky. Now I know what in hell is being talked about. Brad shared his diatribe, I think, with me personally but the mailbot flushed it. The return message telling him it was deleted unread bounced so he is bogus. This had the effect of blasting it off the newsgripe as well so until I got to yours, I didn't have a clue what was said.

My interest is purely recreational. When it ceases to be fun I will go somewhere else. I don't really care a whole lot what the audience wants. Getting to really like killfiles, message rules, and mailbots that learn my preferences.

While looking for PopCom in the local library I ran across a slick idea in PopTronics. You put the three-tone intercept signal on your answering machine quickly followed by a message so the people calling in person don't think you forgot to pay your bill. You can download the signal. Apparently this causes telemarketing software to automatically delete you from the active name list never to be seen again. Slicker than a fresh cow flop.

Wonder if brad responds to three-tone signals?

Dick

Modern handhelds, IMHO, are junk. The best ones I have ever had were a pair of old Raytheon DynaCom's. The older Midlands worked well for me too.

If you want a decent radio, let you fingers do the walking. You should be able to find a respectable CB shop somewhere nearby. Also try the local business radio shops. Avoid the want-ads, most of those are used and abused, and many have been modified by an ape with a hacksaw and an arc-welder.

I only have a couple people in my killfile just because I like to keep
my ears open.

Why is it everyoone has to pick ME as the butt of all the jokes and pornographic twaddle in this newsgroup? I am just about SICK and TIRED of it. My wife is a racist and treats me like crap. My dog looks at me like I am a turd. Even the other bootleggers on 28.555 give me no respect. Here in Florida I have a little illegal CB business going on that earns me a few pennies a month. But the best thing about it is that some of the toothless hillbillies I work for respect me as a serious radio hobbyist. (All this without taking no ham test neither!) Now why can't people just leave me alone? I don't care to be labeled as a criminal even though I am an illegal operator. I am just worried about what these self styled rf cops will do next. It's getting so a man can't even bootleg on freeband without being chastized for it. Let's just all be friends, OK?

Twistedhed's Etiquette Rules for Illegal CB

#1. Squash other stations
#2. Run big power
#3. Act like a total, ignorant ass
#4. Transmit anywhere you damn please
#5. Lie about it if asked

>Are you guys GAY? I am too! Let's get together and discuss ILLEGAL CB STUFF!
>
>
>

Back when I worked for the Navy we used to take 2 inch OD copper pipe and
slick it up with peanut oil from the Base PX. The CO at the PX was a Spanish
fella name of Gonzalez and he used to give me anything I wanted, including
a snootful of wood grain alcohol. Nothing like getting blasted on woodgrain
while keying a 10KW shore transmitter on the maritime distress frequency.
Boy will be boys.

Anyhow, we'd take this 3 inch OD pipe and drop our pants and take turns pretending we had a Tijuana hooker all bought and paid for. Next morning we'd come to roll call with blue teeth and blind spots in our eyelids and holes in our Navy dungarees where they shouldn't be.

I damn forgot what the point of this story was, but what the hell, fellas, I don't care if anyone's illegal as long as you're buying the drinks.

Dick

3086. Re: It's Not Just Twistedhed

Are you sure about that? I think that I have mentioned in previous posts that I definately do NOT agree with the KILLERWATTS. I do understand the folks who have a 50 watt amp (yes, it IS illegal) in their car or truck - my coworker can't raise her husband 4 miles away on a stock CB due to noise at times, yet she can talk close to 20 miles to her husband at 4:00 AM. Of course, much of the problem is the KILLERWATT rigs. This is a problem, but going at flame wars on the CB newsgroup is not helping anyone. When a couple of people consistantly attack a couple of others, just what kind of response do you expect? I doubt most of the people on the newsgroup really want to keep reading all of the flames. I remember well when this started when the CB popularity started taking off in the early 70s. The start of the 'unused frequencies' was the unlocking of the 'clarifier' on transmit (a very simple operation) to allow people to 'slide' between channels. Of course, manufacturers have made radios which are fairly easy to modify (and WOW - if it is business, don't tax 'em and let 'em make all the buck$ they can - hey, better give 'em money to expand as well). OK. There is a problem. My point has been than many of the folks are either 'squeeky clean' or maybe in the grey area. Yep, there is no grey in reality, but it seems unfair to buy a radio that can't reach 4 miles. Granted, that 50 watt amp IS illegal, but some of the flame wars that have been going on around hear seem a bit ridiculous, at least to me. Some of the boardering on porn (or well over the boarder) aimed at two people in particular are most likely to be met with some of the same. Sure, we all have problems. The very few I have had with folks I have handled through the courts, not on some newsgroup flaming everyone. For the record, I do NOT support channels outside of the normal 40. I do NOT support the 100 watt plus rigs. Although illegal, I tend not to worry a lot about 20 or 30 watt radios. I also do NOT understand why all of the flames (often posted anonymously) directed at a couple of individuals.

Finally, I will ask a serious question. I keep reading (sometimes by the folks such as yourself and sometimes by someone bragging about his/her rig) about these 10 and 15 KW amps. I have to assume you are talking 15 KW input? I'd like to see the amp - seriously. I don't know about you, but my service is only 220 volts (I think I only have a 100 amp service). 100 amps times 220 volts is 22,000 watts - before losses in the power supply. I would also have a problem seeing my lights dim every time I called CQ. I suppose if I really wanted to I could put something in like that, but it would take the entire house supply to power the thing. Amps of that sort would be better served with 3 phase power.

Finally, I think what we are seeing (this is my guess, and I'd like your thoughts on it) are the results of deregulation. The FCC has been stripped to the bone. Years ago, when I worked in broadcasting, you needed a 3rd class broadcast endorsed FCC license just to operate the controls of a

NON-DIRECTIONAL am station (and I am not sure, but there was a power limit, perhaps 5,000 watts). You needed the 1st class ticket for television and directional stations. Ah, labor is too expensive, let's deregulate. We just had an instance of 3 deaths in a nursing home around this area - LPNs at best formed the staff - that should not have occured. Yes, their license may be pulled (it is being argued). What has happened is that we have moved to the lowest common denominator - money. What is being reaped has been sown over the past 20 to 30 years. So, until there is some movement to start some kind of regulation, I wouldn't hold my breath. My gut feeling is that much of the military is now using either satellites or the internet, so they are not worried about HF. The FCC staff costs too much money. Unless foreign governments start complaining, I doubt much will happen. Regardless, I do not see the need for all the flames in the newsgroup (especially the porn and 4 letter words) - especially since it will likely do no good and will simply upset a bunch of folks. There may be a few of the so-called bozos, but many are simply enthusiasts, often with questions concerning antennas/legal rigs/grounding and so on. Is there a real reason to flame? If so, what?

Your thoughts?

Jim

3090. Re: Grounding my mobile???

Newsgroup: rec.radio.cb
Date: 2001-04-05 07:50:47 UTC
From: Handy Andy <CodysPC@Iserve.Net>
Message-ID: <l88oct4gfc1aiffvi15ft27r4blfnlc9sl@4ax.com>
Source record: 77516

Greetings!

In a word, reduces receiver noise. Ground potentials differ between connection points - eddy currents form and a noisy ground plane makes the receiver have to work that much harder to pull out signals embedded in the noise level.

Transmit is the same way, a poor ground means poor coaxial shielding.

Once potentials have been leveled off to remove the ground loops, or at least reduce them, a Faraday cage is formed. Everything within the "cage" is at the same potential - and RF is tamed.

Leakage from the radio can be reduced by bonding the chassis of the radio to the same chassis that the antenna uses. Mag-mount antennas require a good RF ground at the radio to make the potentials the same for RF. Then the RF will effectively use the external ground plane of the vehicle.

As far as bonding the tailpipe/muffler and engine block - it's so the eddy currents picked up while moving are reduced and noise is less.

Plasma from still-burning fuel in the exhaust can also generate a noise in the receiver - along with the Fuel pump. The fuel pump alone generates enough noise in some setups to require a noise filter - but only for receive.

However, ground returns from various sensors can also be affected by RF leakage. So good grounding reduces the problems with potentials and errant signals wreaking havoc with the vehicles ECM.

As far as radiate? Little effect, except for the vehicle will remain running while you talk. ;-)

On Wed, 04 Apr 2001 17:33:24 GMT, while the modem was ice fishing with the Mouse, "taxi driver" <taxidriver@uplink.com> dissertated the following:

:+> So Doc how does grounding the muffler, tailpipe, etc help you radiate?
:+> How do they effect your recieve? This is not a base station we are talking
:+> about, how in god's green earth Wil that help. Using your twisted logic then
:+> all 18 wheelers should have no noise level. Give us a electrical
:+> theory/answer rather than your opinion
:+> Like Bada bing said does that mean you load up your vehicle with all kinds
:+> of metal. I doubt it The metal of the vehicle are like ground radials on a
:+> omni, they reflect the signal and keep the ground losses to a minimum, how
:+> does grounding your frame help this, Is the rf mysteriously going thru my

:+> roof and reflecting off the frame... Lets have a believeable theory, So far
:+> bada bing I believe your logic.

Why don't you simply write oh8uv another message, where you say you're an illegal. He has ratted out many pirates in Finland, did you know? Also, please ask if he has any PERSONAL grudge against me? How do you think your American hams would describe you to me if I asked them? A hero? I doubt it.

BTW: other OH hams also read this ng, especially after your message to Markku. Genuine hams with calls and all, and no mercy for pirates, I know.

The bottom line: an illegal nuisance like you does everything he can to justify his actions to everyone, and if someone says anything against you, you simply try to ridicule him. Maybe that soothes your bad conscience, who knows?

Any reader here can compare the two bits of text (oh8uv's and my messages) to see what was written by whom. I will not, however, say anything more about the OH ham in question.

With this I leave you to simmer in your own stew, but will, of course, forward nice bits from rec-radio-cb from time to time.

Gary

For a beginner's effort, not half-bad; give it a 5.8. But seriously Brad,
would not a man of my obvious experience and erudidition know the
difference between ethanol and methanol?

3104. Re: We are dealing with 2, MAYBE 3 folks, that is it.

Newsgroup: rec.radio.cb
Date: 2001-04-05 13:23:43 UTC
From: twistedhed@webtv.net
Message-ID: <16468-3ACC71DF-22@storefull-121.iap.bryant.webtv.net>
Source record: 77531

Why don't you simply write oh8uv another message,

"I do not whom you refer, but I will take a wild guess and say me, simply because of the fact that I did indeed, send him an email inviting him to take part in your posts. I feel your fellow countrymen should see the way you act in here. Would you like it if a bunch of us came trolling to your group?"

where you say you're an illegal.

"Here is where you trip and stick your foot in your mouth. The only one's that call me illegal are you and Hermie. Do a search on me. You will find not one post EVER by me, advocating broadcasting on a hammie band or running power. You won't even find a foul word in my posts, with the exception of an occasional, "hell", MAYBE an ass. The rest are forged."

He has ratted out many pirates in Finland, did you know?

"I do not understand what your problem is other than aligning yourself with Hermie."

Also, please ask if he has any PERSONAL grudge against me?

"What the hell does that have to do with anything? If he has a personal grudge against you, you probably did something to deserve it, judging by the way you have acted here in the past."

How do you think your American hams would describe you to me if I asked them?

"Not relevant. I can not afford to worry about what others think."

A hero? I doubt it.

"You love to put words in people's mouth and spin as well. Maybe you should do the youth of Finland a favor and retire, maybe go into politics or something."

BTW: other OH hams also read this ng,

"Great. Now all they have to do is do a search of you and see your literary might you graced us with over the last year or so."

especially after your message to
Markku. Genuine hams with calls and all, and no mercy for pirates, I know.

"I have unequivocally stated I am vehemently opposed to intruders on hammie frequencies. You just can't fathom it because I don't assail operators like you do. I believe each operator to be responsible for themselves, NOT other ops., as you would like them to be."

The bottom line: an illegal nuisance

"The bottom line is you backed yourself into a corner and are back pedaling feverishly in attempt to save face. You screwed up, Kari. be a man and admit it, and move on. No one holds grudges in here except Dougie, and as I previously stated, if you want to align yourself with him, you are doing a fairly decent job."

like you does everything he can to justify his actions to everyone,

"What actions, Kari? Do not be vague, tell me what I said or do that you dislike. Put up or shut up once and for all, Kari".

and if someone says anything against you, you simply try to ridicule him.

"Hmmm....let's analyze your statement for one second. If someone says something against ME, of course I go back. It shouldn't be about ME. It should be about an issue, and I guarantee you, again, you will find not one post from me ridiculing anyone on their stance to an issue. When someone gets personal and acts like a fool, it is extremely easy to let that person ridicule themselves. The only thing I would be guilty of here would be taking extreme pleasure in the situation."

Maybe that soothes your bad conscience,

"Totally clear, but thank you for the concern."

who knows?

"Not you, obviously. You don't have a clue."

Any reader here can compare the two bits of text (oh8uv's and my messages) to see what was written by whom.

"You seem quite preoccupied with defending something you maintain your innocence of. I would say that is a guilty conscience."

I will not, however, say anything more about the OH ham in question.

"Good. You have brought him up over and over and over."

With this I leave you to simmer in your own stew, but will, of course, forward nice bits from rec-radio-cb from time to time.

"Whatever floats your boat. I'll be sure to pop in every once in a while myself, just to keep you honest."

Ahehehehehehheeeeheheheh! Watch your blood pressure there. Don't want
to stroke out and be in that all too familiar uncaring doctor's office
of yours before you drag your malignant carcass to the hammie fest where
you will no doubt wear your good, stained T shirt that you wash EVERY
month whether it needs it or not and offend everyone that happens to be
downwind from your already-bursting-at-the-seams pocket protector
wearing pre-cardiac implosive, offensive frame. Tell me son, are the
numbers a coincidence, or do you just like forging the same ones all the
time? Ahahahahah! Thanks for throwing in the towel big guy. Have a great
day! :) Oh, yea, lest I forget, catch! (Twisted tosses a dog biscuit,
watching, with true astonishment, as it is snatched in mid-air, as the
canine cocks it's square head and looks somenly and obediently to it's
master, as if to say, yet again, "Thank you sir, may I have another?")

Hey Guys,
Did anyone else get this crap in their mail? Unbelievable that this dude
has the time for these hijinks. :-)
What follows is the body of the message I got in my e-mail today. There
were about 20 messages with the same header, sent over a 3 minute period.
The message was sent as if it was from twistedhed@webtv.net, and the header
say's: Help Napster Now!

----

bk43@pacbell.net,

HEY ASSHOLE HOW YA DOIN?

==========

Napster is under fire. We need your help to preserve the Napster Community
and keep file sharing from being shut down. The only way to make a
difference is to get involved -- JOIN THE NAPSTER ACTION NETWORK!

To sign up, go to: http://newsletter.napster.com/nan/

What's really funny is that I run no power, all I do is buy and sell
equipment that catches my fancy, and somehow I've done something to deserve
the "Wrath of Doug." I've never been to a Key Down. He seems to spend his
day chasing me around the net like a little, following bitch.
I've always been straight and above board as far as the net is

concerned. Never had the need to have an anonymous identity or had to block out my e-mail address. I may have to change that if this person keeps this kind of behavior up.
Wierd.

Jeff

I agree Tim. If you spend less time on the group then that means more time on the radio, kind of defeats Doug so called purpose here doesn't it. Then again I don't think he really gives a damn of whether or not any one talks on the radio. I think he has a problem that only medical help can cure, if he is like this to other people, which I doubt then his problem is more than anger towards CBer's. I heard Doug on 6 meters a while back, sounds kind of feminine to me.
I rarely post on here anymore and rarely read the group anymore so I can relate Tim. Catch ya later, you have my email.

Eric,

Check with a friend who gets QST, or stop in at the local book store and see if they carry it.

It appears from the description that the technique used is similar to something I saw described in "RF Design" some time ago for use in eliminating multipath interference at cell phone sites. The method used time of arrival of the signal wave front at each individual antenna in the array, then used digital signal processing techniques to simulate a directional antenna characteristic. They could make the simulated beam pattern almost as narrow as they want to get accurate directional information. It was a rather interesting article, and shows what is now possible. I think this article, in RF Design, explains the comments I have heard where people claim the cell phone company can track the movement of individual cell phones. I always thought it was just from cell site to the next one. Looks like it's much more sophisticated than that. Big brother is watching.

Notice that the hard core illegal freebooters and outbanders and ampkickers are laying low, Dougie? You can't get rid of us. We will surface once again. You can't catch us because we will always have some excuse ready. If you THINK we are talking about amps, we will say we aren't. If you THINK we are discussing out of band transmitting, we will say we weren't. We will find a way to let people know we promote illegal operation without actually SAYING it. We will find a way to sell amps and do mods and then weasel out of responsibility for it by denying it. We are much smarter and much more important than the average CBer - who we look down on as a pathetic mud duck. We are in fact the elite of 11 meters. So go ahead, forge me. Hey I encourage you to forge me, Hermie. I can use YNN too. That makes it even better. I can get away with telling the REAL TRUTH and everyone will think it's YOU. HAHAHAHAHAHAHAHAHA! Don't that suck?

Jerry Anything can be found, look at the plane that crashed in China, it could detect a fart from Beijing, but a mobile station usually isn't in the same place twice, if you are smart. Of course sitting at home on a base everyday running big watts would be easy pickins compared to a mobile doing the same.

"Bad Girl. I said roll over and play Dead, not speak.
Hyaaahyaaaaaahyaaaahyaaaaaa! Contractions, Hermie, contractions.
Remember last weeks English lesson I beat into you after we brushed your
coat and gave you the nice kitty shaped heartworm pill? I said if you
are going to forge me, do not use contractions. The saucers say they
will zap me if I speak in contractions, so if you want to play me,
please do not use contractions, ok? Wonder if you ever had a life,
besides someone controlling you all the time, or maybe even a
girlfriend, er, boyfriend or whatever you fantasize over besides
ME,,,hmmm...time..boyfriends.....that is it, I bet you have done time.
Ugly time. And lots of it. Now it all makes sense. You are known by your
local authorities as a mark because of what we found out earlier about
you in your little home community. The porn stuff, the cops who know you
by name and reputation, you having to move eleven times in the past four
years, you not being allowed within 150 feet of, well hell boy, just
tell us yourself what you did to get so well known around town.
Inquiring minds want to know. What has been absolutely hysterical is
watching you pound those keys over and over, sweating, oozing and
dripping poison from the diseased riddled mass of cancerous tissues and
lesioned pores that emit a sulphur-like aroma from the vile,
foul-mouthed, drag queen, imitator/forger you have morphed into. Just
the thought of your hunched back and open puss-filled wounds staining
what is left of your torn, smelly T shirt, as you are bent over your
keyboard, in your dirty section eight apartment you dwell in, laughing
hysterically, all the while chanting, "twisted twisted twisted twisted",
```

until you lose control, is enough to give ME a heart attack from laughing. My sides hurt from laughing so hard today. Your seizure like stutter takes over, the Tourettes kicks in, and the result is your gimped wrist banging, swinging violently against your keyboard left-to-right, right-to-left, harder at times than at others, drool pouring out of the right side of your curled hair of a bottom lip forming a milky pool in your lap that the cockroaches instantly swarm to, and somehow, as if by on the sheer determination of your love for me, you somehow manage to email 17 times (chuckle) to certain individuals in the ng, in hopes that maybe, just maybe, you may find just one person that is your intellectual equal that will not know enough to know how to trace a post...(snicker) Have you found one yet? Mmmph, snicker, ROAR! AHAHA! I mean, we know why you pretend to be me, we know why you post porn, we know why you are against cbers, we know why you post to yourself (snicker), we don't care of your homo tendencies, we do not ask...so why do you tell? The highest hand you can play is the joker. Have a good day. :)

The Uniden pro510 has the same deal on it with the phone jack.
The 4-conductor phone jack simply replaced the 4-pin threaded connector on
these low-budget
radios. Changing microphones is easy enough if you dissaemble the stock mic.
and remove the
wire harness then resolder on new mic. I hope your not expecting a huge
improvement in sound
quality, the stock mic. is optimized for that radio. Check the Impedance of
both microphones to
make sure it is compatible.

I have a few copies of old CB magazines I picked up at a garage sale last summer, this guy has 2 4x8 sheets of plywood covered with old radio gear including some really ancient tube base and mobile radios, I picked it all up for $150. I have been cleaning and repairing the radios and selling them if you or anyone else is interested let me know I'll get a list made of what I have so people can make an offer.

the copies I have sitting here at hand are as follows

Febuary 1976 issue of "CB Magazine"
April 1976 issue of "CB Magazine"
January 1978 issue of "CB Magazine"
May/June 1976 issue of "S9 CB Radio"
one issue of the 1980 CB Yearbook

I just thought I'd pass this along. I recently emailed a company that claims to have been in business for 40 yrs, selling radio equipement. My question was about one of the products for sale that I found on their website. I emailed them with the model number and asked what the frequency coverage was. They couldn't tell me!

After emailing the initial question, the reply I got was:

<>

I replied, stating that they are the ones selling it, they should know. Here's the reply from them:

<< we stock over a 1000 ant's unless you can suppy more information like manuf. freq to be used on ,
type of ant like lopne wire, for w/t, for base,tower mt ant. BS-2 MEANS NOTHING TO OUR COMPUTERS JIM PE ABC COMM. >>

When I replied again, stating that I felt this was very unprofessional for a company not to know what it sells and that I wouldn't buy a product from them, here's the reply I got:

<>

Nice and professional, eh? In short, stay away from ABC Communications in Washington State.

Been a matter of law for some time for 911 purposes among other less 'big
brother' uses.

Trashiba used a multi-path or ghost eliminator (great idea in Tokyo) that
worked similarly except it used the owner to help set the time. They
didn't sell it in the US because it also could evade the 'dirty movie in
the motel room' security system then commonly in use for HBO, etc. on
cable systems. The digital offset caper dates back to IBMs first color
terminals and is pretty common in air nav receivers today; set the known
distances of a beacon and your DME will just about take you to the end of
the runway.

It is an open WW2 'secret' that the FCC monitoring stations, particularly
one at Grand Island NE, could range German subs within a square mile in
the Atlantic. They used the undersea cable and put out the data as if it
came from Royal Navy Bermuda.

Not so much 'now possible' as it is using modern computer circuitry to do what had to be done with oscilloscopes (after all a voltmeter and a time-base) and bulky equipment in the 30's. Given the accuracy of modern time bases (GPS anyone?) it should be possible with two readings from a car to tell if he uses the kitchen or the bedroom for a shack.

Never forget the first rule of Aeronautical Engineering: bricks can be made to fly if the customer gives us the time and has the money. Seems Charlie found the money.

The original poster of this matched a trace perfectly with one of the
posts being attributed to N8. There are two or three having at it, one
as we all know, was exposed to be N8, another, I am almost 99 percent
sure is a ham also, who preaches and wears a very different mask here
when posting under his ham call, is going to be exposed soon, I just
need to make certain, but it will come as a surprise to some, and not a
surprise to others. He is quite the cur, and yes, I will have proof.

An interesting thought about high power and mobile operations. Do what you think you must, but please don't have the kids in the car when you run that mobil kilowatt. You do know about e-fields, right? You do understand that an adult human is approaching self-resonance (sure, 9 feet is 1/4 wave - but only in a real skinny wire. Large conductors such as pipes or humans resonate at a shorter length). High power is NOT recommended in mobile installations (at least at the top end of HF and a ways after that). High power is best run atop high towers well away from dwellings. Besides, it seems so foolish to run a ton of power to yak 40 miles. 6 double a alkaline batteries do just fine for me.

I dunno, Dick, but 444.850 suits me just fine; especially when I can punch the funny buttons and patch into the local telephone lines. 444.750 is my secondary (Kodak repeater) with 444.820 being my 3rd choice (Xerox repeater). Of course, there is the multiplex system with access (simultaneously) to 10 meters, 6 meters, 2 meters, and 440. I use that maybe a half dozen times during the year.

Hey all! Thanks for all the responses I have gotten to this original request. I have found 2 suppliers for said power cords here on AOL. At the moment, I am back on the air with my 2510 (did a LOT of SSB this afternoon) with a temporary power cord "hack" until I get a REAL power cord :)

To those that have responded, I will be getting my orders off to you guys here shortly.

Thanks again!
Robert
aka KRT-218 on SSB

Jim, CD Truth asked earlier in the thread about the knobs on a Grant XL that had been modded and I set him up with the table of freqs. Does not seem to have taken him long to get set up for bear.

I don't work repeaters with bloops and beeps -- comes from having built a few. None of them sounded like a misplaced calliope.

: You are a piker. The right way to pin coax is to use two straight pins
: separated by a quarter-wave times the velocity factor of the coax. The
: SWR is 1:1, the receiver works good, but he cannot transmit out of his
: back yard. If he runs power, it is interesting to see the coax after it
: blows up like a wiener in a microwave.

This is myth. Think about it a bit. If there is a short at the first
pin, then it doesn't matter what is past that pin - the coax might as
well just be cut off.

Further, if there is a short, then receive is unlikely to work any
better than transmit.

Try it on your own rig, if you don't believe me.

>They also have a BS-2 but the frequency range was not shown.

Checked again. Nope, no BS-2. But here's the description for the BS-1
which is under a list of CB antennas:

"
1/2 WAVE INDOOR DIPOLE ANTENNA
C. B. BASE ANTENNA COMPLETE w/COAX and PL259 CONNECTOR.
MOUNTS CONVENIENTLY ON WALLS or CEILINGS

$9.95
"

So it said twice that it was a CB antenna, and that is the frequency
coverage. If there is a BS-2, neither I nor their site search could
find it. Please post the link.

Jim,

It is a sad fact that super high power is often associated with "gittin' out", or being the big guy on the block. Just to illustrate the opposite, yesterday, drove about 170 miles to Aiken, SC and back. To amuse myself and keep "company", I tuned down to the high end of 40 meters where some of the fellows like to operate AM. One man was in Kinston, NC, over 300 miles away, another was in Reston, VA, still another was closer, in Lincolnton, NC. I ran 40 watts AM and joined the group near Columbia, SC. I was using all of 40 watts. Yes, conditions were favorable, but, nonetheless, it shows that high power is not the cure all some think it is. I was fully readable by all stations and had no difficulty participating in the round table discussion. It also demonstrates the need for an efficient antenna system. If folks could only grasp the problems that are often CAUSED by unnecessary power, realize that it is not often needed, and consider that others may be attempting to use the frequency in other areas, communications would be better off for everybody.

Jerry

Nope......Not me.....Even my friend Twistie knows I have him in the kill file and wouldn't see his posts. He even understands my reason for putting him there and has nothing to do with him as a person.....Just the threads that have been running for some time now.
If one were to check my real IP and this info from the start of this tread, Mine is a little different IP addy......

You must think I am a paralytic brained imbecile like you, Hermie. Now you will be confronted by a number of new ISP addresses that I will post from. I can do it just like you can, Hermie, and MUCH better. Last time I whipped you sensless, but you asked for more. So here you go, open wide for my giant engorged something-or-other (I will leave you to guess what it is you are swallowing now, Douglas. Needless to say, it is propitiously large and well developed) Here are my current plans for you. I will make you cry "Uncle" first while polishing the coax connector to my illegal 25 to 32 Mhz base station. Next I will announce that I hold you in the same contempt that I hold Tim Nebo, Moparholic, Scott, Bill Eitner, and all the other LOSERS that have run away and left me to do battle with you alone, Dougie. Thirdly but most urgently, I will likely find a way to travel to Dayton and confront you in a war of words from which you shall not arise unscathed. This is merely the beginning, Hermie, and it is not the saucer men that motivate me to these ends.

I'd really have to dig through some of my older magazines, but there's already been several documented 'busts' of Hams who operated mobile (jammers & such... no ID). I distinctly remember the story of one who was pulled over by the State Police along I-90 somewhere out west (Colorado, I think) after being tracked by 'Uncle Charlie'. (this ain't somethin' new either.... happened about 6 or 7 years ago)

About the mobile who's never in the same place twice.... most mobiles operate on their way to work, while working (trucks), or locally (all operating in ways that put them in the same places time and time again).... I doubt very many can or do spend the day aimlessly driving about the country just to avoid detection.

Bull, Bill. In my own cb shop I have tested quarter wavelengths of RG8 with pins through them and I get a signal at BOTH ends. It is only if the velocity factor exceeds the coax length do you get no receive. Go back to school.

Spring in Florida is kind of depressing what with all the unemployment, drugs and disease. I wear these big sunglasses that make me look like a bug, but they keep the Florida sun out of my eyes. The waitress at the local Stuckey's said I looked like a moth with a head cold. Well, what I want to know is if I hook up a Foxie 8-pill to 440 VAC will I get 4 times the power output. I wish I could do this because there is a guy on 27.555 that makes fun of me and I certainly would like to squash him. I am asking you this because none of the others will talk to me anymore and have abandoned me to fight Dougie by myself and you seem like a fair-minded guy who does not discriminate if a fellow wants to run a little power on the freebands. (PS, the amp has a mean-looking skull design painted on it, and that helps bolster my low self-esteem somewhat)

You could take this to another ng, such as alt.radio.cb.skip. But all this has turned into a personal war between two people. I have no interest of even being associated with the likes of those two idiots here. I'm gone. If anyone want's to discuss CB, email me.

Twistedholic, Moparhed, et. al; and Dougie, you pathetic forger; you are both wrapped too tight. Think of all the good things that you could have been enjoying while you were composing personal attacks on each other. If you don't let it go, one or both of you are going to end up in a rubber room. Probably both. And probably the best place for both of you and all your identities. Can you say "mulitple personality disorder"?

Don't reply with excuses. Over the years I have heard them all. Like I said before, it takes two to tango, and both of you deserved the abuse you received. Now let it go and move on. Or don't. It doesn't matter, because I won't be here to see it, so I don't care. In fact, feel free to say what you want about me, because anyone with any intelligence can read headers and previous posts, and can see that both of you are warped.

What a waste.

Sparky, I'm gone.

This really offends me.......I've been all of the things you are bitching about and will continue to be. All you complaining in the world isn't going to stop the people from doing what they want to do. If you happen to not like the things happening in CB radio (the things you are moaning about have only been going on since before I ever got into radio in 1975) then you need get used to it! PERIOD!

Actually, the laughs were at the idiots who take it upon themselves to spew hate and discontent about the radio waves and the NG, who take it upon themselves to be the informant against all that CB and the US Constitution stands for (freedom of speech, and the persuit of happiness, to name a couple items). I find I must laugh at the idea that someone has absolutely nothing better to do than to work their own bloodpressure up, scream, yell, instigate, and otherwise be disruptive no matter where they are.

Really, I shouldn't laugh. These people really need help, or a life, or a significant other of some sort... something to take their minds off their droll, meaningless existences so that they may, at some point, lead a somewhat normal life and return to a veritable facsimilie of normal mental function....

I know, I know.. they're all pipe dreams. But without dreams, all hope is lost.

3188. REAL opinions

Newsgroup: rec.radio.cb
Date: 2001-04-06 09:20:58 UTC
From: Sideband <sideband@spam.me.not>
Message-ID: <3ACD8A7A.E8344189@spam.me.not>
Source record: 77728

Ok.... First let me start out by saying that I'm NOT posting this to start a flame war... I'm simply interested in the opinions of the NG on a couple of issues. I will also state my opinions as a reply to this initial post. Please set aside FCC regulations as points of argument. I'm asking these strictly based upon civility and etiquette.

1. Freebanding. What exactly is wrong with utilizing unallocated frequencies between channel 40 and the bottom (top?) of the 10 meter band? That is, between 27.405 and 28.000 Mhz.

2. Running power on the CB band, provided the system is "clean," meaning not overmodulated and with effort and care taken not to cause spurious emissions, in the range of:

A. under 50 watts.

B. under 100 watts.

C. under 500 watts.

D. under 1000 watts.

E. over 1000 watts.

I look forward to your answers.

>1. Freebanding. What exactly is wrong with utilizing unallocated
>frequencies between channel 40 and the bottom (top?) of the 10 meter
>band? That is, between 27.405 and 28.000 Mhz.

The first argument: those frequencies are not allowed by the FCC. So
why should that matter? Because the increasing abuse of the CB, and
abuse of the radios built for the CB to use adjacent frequencies, will
eventually make the citizen's band illegal (and I stand by this
statement with 5:1 odds).

Second, the people that operate on the so-called 'freeband' don't care
about frequency or power (if you can find a freebander that doesn't
use an amp, you are the first). Their harmonics blast into the CB, ham
bands, FM radio and TV. And, if the power is high enough, they blast
into electronics that are not even powered, such as stereo speakers
even when the stereo is turned off. Very few illegals will admit this
happens because they don't care.

Thirdly, because the increasing abuse will eventually lead to more
frequencies being used where they should not be used, and more power
in places it should not be. While some may scoff at this idea, history
speaks for itself. Call them squatters, freebanders, or pirates, the
effect is that they are taking something for their own personal use
that should belong to everyone. There are currently pirates on
shortwave, longwave, VHF, AM, FM, and TV broadcast. The number of
pirates on "open" frequencies grows daily. There comes a point when
the resources exceed the demand, and that is what the FCC was designed
to prevent.

"Open" frequencies are there for various reasons. Some are to provide
a 'buffer' zone between bands. Some are allocated to astronomical
research and are receive-only for transmissions from ET. Some are for
intermittant or emergency communications. Just because nobody uses it
doesn't mean it's "free".

>2. Running power on the CB band, provided the system is "clean," meaning
>not overmodulated and with effort and care taken not to cause spurious

I would like to see the CB limited to 100 watts. Too bad that so many idiots have to spoil the 4 watts we have been granted. Give an inch, they will take a mile.

> C. under 500 watts.
>
> D. under 1000 watts.
>
> E. over 1000 watts.

There is already the 'Amateur Radio Service', which allows people to use power like that. Just get a license. Too lazy? Too bad. Take it for what it's worth - i.e, look at the big picture. The FCC has allotted a large part of the spectrum for Amateur use. Above and beyond, they have even set aside a little bit of the RF spectrum for those that don't want to learn anything.That's more freqs and more power than most people will ever use or need for a hobby. Isn't that enough? Are the FCC rules to tough to follow? No, not for a person with an IQ higher than that of a limp noodle.

Sparky, FLCD

Provided the CB'er doing this isn't interfering with HAM operators, emergency frequencies, or anything of the sort, and that the CB'er isn't bleeding over onto commercial, emergency, and HAM bands, I feel it's perfectly acceptable.

A, B, and C are OK, again, provided care is taken not to bleed over and interfere with other stations, commercial stations, and emergency stations

>
> D. under 1000 watts.
>

Here's the "grey area" with me.

>
> E. over 1000 watts.
>

Just rediculous... If you can't do it with 50 watts, you should take a serious look at your antenna system, and think about finding a way to make a better RF radiator. Power isn't the answer to every "get out and touch someone" problem.

Just my two cents.

I am the man you people know as "twistedhed"s neice. I am using the computer to ask you all for help. I saw him today out in the chicken coop. He was barking like a dog and scratching his nuts. Then he looked at me and shouted "I MUST HAVE YOU DOUGIE!" I told him I was not Dougie but it didn't stop him at all because then he drooled and started running after me. With his limp it wasn't hard to outrun him. Later I felt sorry for him and brought him some maggoty beef to chew on. "MMMM" he said "DOUGIE I LOVE YOUR TASTE". Ewwwwww! Can't someone put him out of his misery? Please?

I am Twistedhed's Penis.

I am a tiny little thing.

Even so, I get yanked all day.

I am punched and prodded and twisted to and fro.

I wish I was on someone else. Someone normal.

I wish he'd get another hobby besides me.

Uh oh. Here he comes again.

Maybe I'll run away.

Gary,

I am not taking an illegal point of view by stating the following: You are way off base. You are now trying to make this an issue of national pride. Guess what? The only thing the UK is good for is to get the US involved in global conflicts, and just so the US can bail them out if they get in it too deep. Somehow they managed to take the Falklands by themselves - like it was a challenge.

Finland wouldn't even be a country if not for US economic support every year since WWII. Half the world's countries can't hold their own if not for the US. They make a deal with the devil, and they hate that. Need proof? What's your country's second language?

Don't even bring such lame arguments here.

>

As you might be aware, we are not allowed to use ham calls on CB channels,
hence my CB handle Karppi, when I was active there.

> > Whos has chosen you to be a "technical advisor" in Cb matters, I
> > wonder?
>
> Where in my post did you see anything about
> me being a "technical advisor?"

When I first forwarded your messages from rec-radio-cb, you replied in one
of your messages that I should regard your as a "CB technical advisor" -
your own words. I was happy to see that you no longer regarded yourself a s
a ham, but accepted your illegal role. A clear majority of your rec-radio-cb
messages have been and are advice on how to modify CB rigs, how to adjust
the amps etc. I have numerous of your messages stored away, for further use.

>
> > Was the appointment approved of by the ARRL?
>
> See above.

You see above: how do you think the ARRL react to your CB interest and your
role in the ng rec-radio-cb? Now I am, of course, NOT talking about LEGAL
CB - it's a nice and good hobby, unlike the pirate-type of "freebanding"
which is the main point of interest in rec-radio-cb.
>

You are a very, very typical CBer we meet all over the globe: you think that your signal stops at the U.S. border, which it doesn't. As I am writing this, there are plenty of illegal ops on ten meters, especially the CW part of the band. I regret to say, I also copy illegal Americans there. Hence my interest in your activities. Okay?

Not a damned thing (unless our wonderful government has plans on selling it
as they have other bands) because in the US it does nothing more than act as
a buffer betseen 10 and 11 meters anymore. It doesn.t appear to be in use by
the services it was allocated to.

General Electric 3-5794 "Superbase" - 40 channel (O2A chip) AM/SSB Base.
Extremely fine condition. Works / Looks flawless, comes with original hand-mic
and copy of the factory manual. Digital Clock / Alarm / Built-in Speech
Processor all function normally. No butchering/screwdrivering. Picture of unit
available upon
request $200. OBO Double Boxed and Shipped. E-mail if interested to
n4ehx1@aol.com
THANKS for reading..

3216. Re: REAL opinions

Newsgroup: rec.radio.cb
Date: 2001-04-06 12:51:01 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <3ACDBBB5.3D33782@oio.net>
Source record: 77740

Sideband,
I think your making two assumptions that are not true,
or very realistic.
1.Freebanding: The so-called 'freeband' frequencies are
already allocated. I know of several services that have
frequency allocations both above and below the regular
40 channels. They certainly don't account for all the
frequencies between CB and the next higher/lower commonly
recognized bands, but I certainly don't know all of the
services in those areas either.

2.Running Power: In the 'real world' very few of the 'CB'
amplifiers are 'clean'. There are all kinds of reasons,
from basic design, to the manner in which they are installed
and used. In most cases, the end-user is the biggest
problem, they just don't know enough to do it 'right'. (NOT
just CB'ers, but ANY end-user)

Those are just two reasons, I'm sure there are others. Like
it or not, CB'ers are still a part of society and have to conform
to society's rules, or face the consequences. If you want to
change the rules, then do so! But, do it 'right', other wise it's
like beating your head against a brick wall. You can do that if
your want to, but don't complain about the head-ache!
'Doc

I can't seem to find, or remember, the exact issue in RF Design I read about the details of the cell phone multipath eliminator system. I do seem to remember where the article talked about DSP techniques being used to extract directional, and signal strength, data from the antenna array. While not exactly a new technique I got the impression it has not been around that long either. As a matter of fact there was a specific name for the algorithm being used. I would like to go back and reread that article to refresh my memory if I can find it again.

3218. FCC vs Antenna Placement Restrictions

Newsgroup: rec.radio.cb
Date: 2001-04-06 13:10:08 UTC
From: qrm2000@aol.com
Message-ID: <20010406091008.27728.00001924@ng-fk1.aol.com>
Source record: 77742

Those who live in subdivisions may wish to visit the consumer section of the FCC web site (www.fcc.gov/) for the latest Fact Sheet on Antenna Placement. This helpful guide was written in February 2001, and is in Q&A format.

It appears that the FCC has stepped in to insure that homeowner associations cannot impede a resident's ability to pick up television programming over the air or by Satellite, and it recently expanded this authority to cover antennas that receive and transmit fixed wireless signals.

At this time, the FCC is not extending protection to other types of antennas, such as Amateur, CB, GMRS, etc.

Can ya' feel the heat, oh small minded obsessed one?
Aheeeehahahahhahahah! Is it not the absolute most hysterical thing you ever saw? I can set my own personal dog on remote, when I have a position that dictates entertainment, I snap a few biscuits at Lthe doggie and the poor hammie barks.
What is the matter? It is the sound of a career minimum wage earner having his face rubbed in his own fecal matter. Found your remailer, but you are too stupid to realize more than a few of us have your number...ahehehehehehhhahaha...But that is ok, just because the adolescent gay porn chat rooms banned you for nonpayment of services in your section 8 apartment. Oh, I love the envy, ahahahahaha, the greed, (snicker), post a few more times today, slave. You shall quit when you see the light in your rear view snotboy, ahahahahahah...you do know that you're busted don't you? And I am gonna be the one to expose you to the world, here and your ham sites, so you should just sell your stolen equipment now hypocrite..ahahehehehehahahahahahahahhahaha...what pleasure I derive from commanding you at every turn. You are a no one, the hams don't even like you..ahahahahahaha..which is why your limp wrist does what I command, day in, day out, all day, twisted is your GOD, nothing is on your mind besides twisted...hehehe...you can't even figure out who you are posting to most of the time..ahahahahahhahahahaha you must answer each and every thing I say...always...your lack of confidence is overshadowed only by your desperation in frantically searching for a kindred soul (mmmmph...like that would happen, hyukhyukhyuk) to seem sympathetic to your shortcomings and lack of sense. Try again. Maybe with the Tourettes comes denial, you can plainly see the writing on the wall, I guess it is a cwy for help. Do not worry, property of mine, when the authorities come your way, you will probably get out of it
due to you handicap...ahehehehhehe! Go off to work now (Your work consists of me making a fool of you and you playing dressup to be someone who wouldn't give your soon to be rotting carcass the time of day.), ahaahahhahaa! By the way, how is the weather there? I hear it is getting warmer. Poor confused androgynous Hermie. Waaaaaa! No one will play with you, just kick you in them green 6 teeth you have left..ahahahaha! Real humans are gainfully employed, but not youL, you sit here, day and night, night and day, popping veins and burning up the 4 of the remaining 5 brain cells you have left, convincing yourself that some way, some how, you will defeat the mighty twisted who has single handedly reduced you to nothing more than a quivering, cowering mass of anonymous (not anymoreeeeeeeeee) jello (soLoon, boy , this gonna be fun..life is great when you AINT AS STUPID as
you...ahahahahahaahaahahha) who is at my every beck and call and hangs on my every word like an earnest young boy who is in complete awe of his

pater after observing him urinate for the first time. Ahahah..you think that a few posts through supernews was gonna cover for you? Ahahahahahha! Fecal brain. I ain't gonna tell you where else you slipped, 'cause you're still doing it. I look forward to you, "spitting in my face", but since you are nowhere near Ohio, never had plans to be, and haven't the gonads to be a man, we know you are just hiding, PRETENDING to be some one you ain't. But since you know I know who you are, well, scratch that 'cause we know you don't have the courage of a little girl, do you Mr. Snot? Since you depend on a government check to support yourself, I have a feeling the feds are gonna get a whoLe lot of email (read:payback), but rest assured, incapacitated one, you will not have to wet yourself because of me. At least as long as you never meet me...nyuk nyuk nyuk! After alluding that the door is about to slam on your furry tail of rancid filth, I had 26, can you imagine, 26 emails asking not only who, but where you are, and out of those 26, there are seventeen states just asking where you live,,,,hahahahhahahahahhahahah!. That is a real easy one, ain't it? It's on QRZ.com Doug himself should kick your ass for what you did. Funny thing is, I bet he could..ahahahhahahahahah, he wasn't a coward, (well, not all the time) he posts from his real addy, not like the poor section 8 Hermie who has zero cajones.ahahahahahah..but we knew that. Poor bipolar thing, try to act the upstanding ham and it's all crashing in around your illiterate girth., aheeeeeehehehehe...I love it..although my sides are a bit sore after laughing at you all day yesterday...I knew you were sewage matter when I first saw you here. With the impenetrable control I have over you, it's no wonder you stay here to worship me and turn my word to scripture, if someone made an ass of me like I did to you, I would cwy too.well, no I wouldn't, 'cause I ain't a hermie..hahaha....only I don't just make you cwyL, I make you beg for it, and there ain't a damn thing you can do about it except try harder to be me and fell sorry for your incontinent self and wait,,tick, tick, tick!! AHAHAHAHAHHAHAH ROAR!!!!!!!LMAO!!!Oh, there is one more thing you WILL do, you WILL continue to stay right here, 'cause you know your exposure is coming real soon, and ya' know what? You don't want to miss it! I am gonna let you cut your own throat by denying it. I gave you the rope and you ran with it and tied it around your neck..I am gonna have a blast kickin' the chair out from under you. But you are going to do the final laceration!!!! All those CC emails you sent? Perfect. Remember our email exchange? You bit hook, line, and sinker!!. Serves you right!!! Now what you got? AHahahahahahahahahaha! As I stated, all you have are jokers, fool! I'm shoving the Ace of spades down the back of your skirtLhahahahahaaheehheheeh!!

I tried to post a follow up to this earlier and the network went down. One more time and this will be my last comment Dennis. It's time to move on.

: Dennis W. Ostrowski <dwostrowski@lucent.com> wrote:
:> Ok, then... time to correct your mistakes...

: So far the only mistakes I'm sure I made were:
: 1) The use of the term avalanche mode instead of Thermal Runaway

You described the transistors as bridged across the DC supply line, your post reads like all Ge transistors will fail in DC power supplies, you desribe replacing excessively leaky transistors into a circuit (something I would not do), you fail to qualify and compare the circuit for both the era/time period and technology of the time, you mention your patch repair to a problem that can and should be dealt with by dealing with the cause. you throw out a lot of general statements without supporting evidence. Some of your circuit descriptions were way off and wrong. You mention the inverter circuit uses a modified AC sin wave when in fact it is not. Those are the only mistakes I care to mention now...

: 2) Starting to debate this issue with you.

I can take and circuit description and topic to any level you can would care to have a civil conversation about. I like to deal with the facts and real world information.

:> You write a lot of things without supporting evidence or
:> proper references.
: I believe that statement applies equally to BOTH OF US!

What statement do you want me to supply information about Dennis..?

:> One would assume any installed transistor would have very little or no
:> significant leakage current.
: That would make an ASS out of the person making the ASSumption.

No, the ass would be the technician who didn't test the part before he put it in.

:> It wouldn't matter if it were Ge or Si type,
: Sure it does.
: The leakage currents in the Silicon doping do not increase at the same rate
: that the leakage currents in Germanium parts do.

Doesn't matter what type it is as long as the mfgrs specs were kept.

: What is YOUR explanation for the demise of the Germanium transistor?
:> both types will try to run away in excessive heat conditions.

Without seeing the amplifier myself, an educated guess might be a nice
spike or surge when someone with a low car battery went to start their
car. Have you ever looked at a cars electrical system while the starter
is cranking..? ... it's pretty horible... Ever heard a thing about reverse
polarity, mov and back-feeding protection..? You might just notice that
most all current designs have fuses, reverse diode and spike protections
built on board.
Have a look at Ge transistor specs Dennis, notice the break down voltages
are a lot less than Si types. It doesn't mean Ge types are bad, it means
you have to consider all the potential sources of damage.

: The silicon does not run away as quickly.

You make it sound like temp is the main and only cause. You or I can not
know what actuall causes a failure unless we are there with instruments in
place, hardly possible most of the time.

:> You make the
:> use of Ge power transistors in a circuit sound like a crime... it's not.

: Then why are there no new designs using them, and why did all the manufacturers
: all stop producing them?

Pretty much Cost and preformance...

:> I have some serious heavy duty power supplies which use common Ge
:> type power transistors, running without problems since the 70's. Not a
:> problem even when they run hot in a classic General Electric EP-38 power
:> supply.
: Good for you.

Good for the 20 plus years they've been in operation... I hate going to
remote locations to repair power supply problems.

:> :> The term bridged is not really accurate or proper.
:> : I did not say the circuit was a bridge circuit.
:> : I said the power transistors were bridged across the DC supply.
:> They are not bridged across the supply, your still wrong...

Notice that transformer winding in series with the transistor..? It would
be wrong to make your statement as posted because you leave out the other
part(s). You should say the series parts are across the supply, else your
description leads others to belive you describe only one part and that is
wrong, and potentially dangerous.

: When the effect of the series parts is negligible relative to the condition
: being considered, they can be omitted.

The circuit will not work with without the transformer. Description of a
condition and the physical layout/connection of a part are way different
things. You tend to mix and match which shows your lack of a formal back
ground. I like to ensure people know the difference because people
often get hurt with bad information.

: The .002 ohm DC resistance of the transformer winding can be considered as
: having a negligible effect on the one or 2 amp leakage currents and their
: resultant 10 to 20 amp collector currents.

: 20 amps X .002 ohms is only .04 volts.

Again, 2 amps of leakage current means the transistor is bad. Replace it
with another that doesn't have the problem. I do it all the time. Don't
leave or install bad parts in amplifers, it's that simple.

: Even if the transformer was highly in-efficient and had a primary resistance 10
: time higher, the DC drop would still be less than half a volt, so it's effect is
: negligible and the devices can be considered BRIDGED for any DC analysis. And
: leakage current on standby is a DC analysis.

Transformers don't use constant DC most of the time, there are exceptions,
but this is not related to the current topic. Proper in-spec transistors
in place will work just fine, mine have been doing said for many years.

:> The output of the inverter is rectified back to DC as high voltage. The
:> portion you were talking down is the inverter section which is a modified
:> AC source/chopper. When your trying to nail down an issue, you need to be
:> specific.

: I was extremely specific.

: I'm not even going to shoot you down for the use of the terms
: 'modified AC source/chopper' because the context of what you were
: trying to say came through fine even if the terminology you used was
: not the most correct.

You have something more exact to describe operation of that specific
portion of the circuit..?

: If the AC output is not used for anything but the input to the
: rectifier, the unit is a converter, not an inverter.

Your jumping back and forth, trying to dodge the real facts, then jumping
in and out from one portion of a circuit operation to the entire circuit
description.

In specific, we have been talking about the operation of Ge transistors in
the inverter/chopper side of an classic tube amplifier HV power supply.
Past basic considerations, what you do with the energy on the "secondary
side" had not much to do with the choice of Ge or Si transistors.

If you want to jump out of local circuit specifics to the larger picture,
the entire package is called a classic mobile inverter HV dc power supply
and your "converter" label is not even accurate. Converter is a
non specific "blanket label" used to describe a circuits operation without
too much detail. You lack detail...

: If the AC output was used for something else, you could call it an
: inverter.
: It's simply a matter of definitions.

: I didn't make them, so please don't blame me for them.

It wouldn't matter if I used the same circuit for AC or DC, the hv power supply label stays and your converter label fades out as bad generic information.
I use definitions supplied by technical hand books, like the ARRL Handbook, The "sai" Radio Handbook and many others. All the proper information can be found easy enough.

:> Cannon fodder.., you throw out a broad statement without any supporting
:> information. We are talking specific about a Kris 300m by itself, not
:> comparing it to an Alpha or similar quality amplifier. Remember the price
:> range and type of amplifier it is/was designed to be. It fits the
:> original requirement(s) quite nicely.
: My broad statement was related to my personal; experiences with them.

Then you tell your reasons which I debate here as faulty. That's what this place is about, opinions and information.

: I may have repaired 50 or more units over the course of the last 30 years, and
: in almost every case there were no other signs of misuse, and the amplifiers
: were WORKING FINE when their owners shut them off.
: They discovered the blown fuses when they tried to use them the next day and
: they would not turn on.
: That's why they did not believe that one or more of the converter transistors
: were blown out.

See my above information about other potential sources of failures in mobile equipment. You can not know, unless you were there at the time and had things well metered and recorded. That's not practical...

: Adding the extra relay, or in some cases just permanently connecting the
: feedback system and using that already existing relay contact to switch DC to
: the converter, solved the problem.

It was a patch that worked, my amplifiers don't require it, new amplifiers don't require it. They have proper reverse diode and mov protection.

: Now they could turn the unit off while it was still working, no matter how hot
: it was, and the leakage path was broken, so the transistors could cool instead
: of going into thermal runaway.

You assume everything is thermal runaway... never assume unless you know.

: Actually, I did check some old Kris 300M chassis that I had junked out for
: parts, and they DID have doorknob style transistors in them.

: To make sure I did not have some special or custom modified chassis I dug out
: the old factory manual on them and the factory specified converter transistor
: was a 2N4048, which was a 60 amp Germanium transistor in a TO-36 case, which is
: commonly called the DOORKNOB style case.

Where and by who..? Where is it written in any text or magazine in regular publication..? .. more than one source of that label supplied to

that specific type of transistor..?

: They were NOT the TO-3 cased parts as you had insisted, and my memory
: was NOT wrong on that issue.
: But that should NOT have been an issue at all!
: And you should not have made it into such a big issue!

You blame it on the transistors, I question your reasons, your information does not support your statements. I never said TO-3 in specific to my posts about the Kris. You talk about heat problems and that's case related.

: The issue was Germanium leakage problems and the extremely small amount
: of heatsink surface area on that amp., not the size and/or style of the
: transistor cases.

And I'm stating facts and examples that Ge transistor power supplies work well when operated properly. I also state that my Kris handles normal expected duty cycle heat just fine. I also state that it was the technology of the time and quite common.

:> Again you mention Ge Transistors as a problem, you really need to go
:> back to the books and study more.
: I feel fairly secure in my understanding of the problem.

Even the tall Ostrich puts his head in the sand... Open your eyes and read more Dennis.

:> The use of Ge transistors is not a
:> problem in power supplies it's been done hundredes of thousands of times
:> in the past.
: But they are NOT used in any new designs because better parts are available
: that do not have the thermal problems that Germanium has.

Doens't mean original old parts are bad. Both Tubes and Ge solid state devices are still made, used and sold over the counter. Thermal issues are not a problem if you know what your doing.

:> It's not as common these days, but Si transistor in similar
:> circuits is also going down in favor of fets and other newer devices.

: The circuits are quite different because FETS are voltage operated
: devices and Bipolar Transistors are current operated devices, but I'm
: sure you already knew that.......

Yep, but it's off topic...

:> You've got to know your old technology along with your new devices Dennis.
: I'm an old guy so I am pretty secure with old technology, and I am trying to
: keep up with the new stuff as it becomes available, like the new ORGANIC
: transistors I am playing with now and the optical switchers that move tiny
: little mirrors inside a chip to redirect (switch) optical data links without
: converting them to electrical energy first.

Notice the domain of my Email address..? A lot of reading, building and
experience keeps me up with old as well as the new. Most of all, an open
mind is the best asset.

: I just never ran into any other amp that would blow itself up AFTER it was
: turned off!

keep playing... I've got a list of bad circuits and how to improve them.
I've posted some of those improvements on the sonic server.

:> It's a common practice, nothing wrong with that... Check most of your
:> common Astron type DC power supplies, you'll find the voltage is
:> always applied to the pass transistor collectors regardless of the output
:> status.

: I did, and I found that the pass transistors are NOT Germanium.
: Put in a Germanium part, get it hot, and see what happens.

I have a very similar power supply as mentioned Earlier, the very classic
GE Master Pro EP-38 Base supply. It honks out energe 24/7 for decades (yes
I typed decades) with never an issue/problem. That's because we don't
exceed the mfgrs ratings. My kriss functions because I don't push the
keydown time to unreasonable lengths. My mobile stay alive because they
are removed from the DC supply line while my motor cranks over. Not to
mention they are reverse polarity and spike protected.

:> : Therefore the leakage current path continued to exist at all times, and
:> : if the transistors had a high enough current gain the oscillator
:> : actually continued to oscillate at a low level.
:>
:> Boy, you really are out there Dennis... and completely wrong.
: How can you say that without having been there?

I've been there many times... worked with lots of Ge transistor circuits.
Heck, I've even designed a few in the last year.

: Why don't you run your Kris 300M until it get's hot; say 60 or 70
: degrees C at the heatsink, and then put a scope on the oscillator......
: I'd say there as about a 25% chance that you will see those low level
: oscillations yourself.

It has not been a problem yet...

:> : The Plate voltage would drop to about 60 VDC because any voltage higher than
:> : that caused enough plate conduction to load down the oscillator enough to keep
:> : the voltage from rising any higher.
:> : They didn't all do that, but a lot of them did.
:>
:> I really don't understand what your trying to write, but it reads like
:> your trying to fault the amplifier in lew of some lousy or bad
:> transistor experience.

: Not just one experience, but a multitude of experiences.

It still didn't explain what you were trying to write above...

:> My 300m amplifier works quite well, has no
:> significant inverter section leakage current and still has the original
:> parts in service... some 25 plus years later.

: That's great. I'm very happy for you.

Tastes great... less filling...

:> : You could put a scope on the transformer leads and actually see that
:> : low level oscillation.
:>
:> Every Technician, Engineer and Hack out there will find an oddball problem
:> or two... three... or twenty in their travels. You statements read like
:> you found one.

: More like 20 instead of one.

You are the first to mention it as far as I've seen anywhere. But I will
consider your statements.

:> So don't shoot the design down unless your qualified to
:> make statements which can be supported and reproduced many times.

: How may times are necessary?
: Out of maybe 50 repairs, at least 40 of them had the problem.
: The symptoms were extremely unique.
: Owner would shut off a working unit and the next time he tried to turn it on it
: would not turn on because the fuse was blown!
: You couldn't miss that symptom unless your head was somewhere it shouldn't be!

And you can't blame it on thermal runnaway without being there and
knowing all the potential problem sources. You missed a few. Now your
up to 50 repairs of the same amp...? Are there that many running around
your area..?

:> Back to the books with you... it better describes a "mode of device
:> operation"... not exclusive to SCR's by any means... I have many
:> transistors here which operate in avalanche mode.

: Here we go again with the 'nitpicking' which has no relevance whatsoever.

You were wrong, you used wrong terms and provided wrong information, it's
not nit picking, it's the facts in real terms.

: For your information there are many different types of DIODES that also work in
: the avalanche mode.
: Can you name at least 2 of them?
: In any case, that is an irrelevant tangent.

Off topic, you keep trying to go off topic quite a bit.

:> Other devices not
:> designed for said can be operated in avalance mode if proper
:> considerations are given.

: Like current limited breakdown?

Look up marx banks on the web Dennis, I design pulsers and marx banks all
the time.

:> Sounds like the transistors were bad... my amplifier shows none of the
:> problems you mention, with the original parts.

: You have been very lucky.

I hope to stay lucky and use my amplifier as time allows.

:> You trashed the whole amplifier based on a repair.
: Based on a multitude of repairs.

50 or more of the same amplifier... I do amplifier work all the time and
have yet to see 50 of the same amplifier.

:> I've never trashed
:> any of the Alpha, Heathkit, Dentron amplifier circuits after a repair
:> until I've verified it is a real design problem.
: That's good.
:> Then I post my opinions
:> on my web page... You can see them there now... http://sonic.ucdavis.edu
: I'll pass thank you.

Too bad, you'd see that I know a bit about amplifier circuits of many
types, plus I have a really cool south park library there.

: I taught at Morton College for a while because it looked good on my resume',
: but the old saying is very true.
: Those that can, do; and those that can't, teach.

Are you saying you couldn't do something so you taught..? Or are you
trying to make fun of my Email domain suffix..? Both reasons for your
statement don't do anything to help your sinking cause and again, your
trying to go off topic. By the way...
You didn't say what you taught..? Thermal Dynamics, Physics, Chemistry,
Math, Electronics or Engineering..?

:> It may not be complete, but it is a better description. Even I eat humble
:> pie once in awhile. It's part of the process of learning... when you stop
:> learning, your dead or close to room temperature.

: Prove that by admitting you might have made a mistake or two in your last
: rebuttal.

Where..?

:> It should operate
:> with about half that amount, 20 amps should be enough... I'll have to
:> measure it again.

: But the 30 amp fuse should 'hold' at 30 amperes without blowing, correct?

:> Again, If you have any significant leakage current in a static/idle
:> (receive mode) state, the power transistors should be considered bad and
:> replaced.

: I have replaced them with brand new Motorola devices and still had customers
: bring them back for the same reason (and with the same symptom) until I started
: switching the DC path to the transistors.

Hey, did you ever consider the relay you installed hid the real cause, the
items I mentioned way above..? I'll bet you didn't... shame on you for
such a closed mind..?

:> A bad transistor is a bad transistor... Here's a hint... I
:> often steal them out of really old Motorola tube two-way radios... the
:> "T-Power" line had great replacement transistors which drop right in...
: I have done that too, but it did not make any difference with those amps..

Did for me, I saved mucho money and I had them right there...

:> If they had significant leakage, they were bad before you started down
:> the road with amplifier on...
: At that time I had an RCA transistor tester which measured the leakage
: currents, and at room temperature the devices I installed met or beat the
: factory specs..

OK... they worked

: I still have that tester, a model 502 I believe, but I don't use it
: for much anymore.

Easier to use a simple fluke multi meter.

:> Others designs are better, others are very similar and work just as well
:> as my unit does, without problems.
: Whatever!

the proof is in the working amplifier I have here... with the original
parts.

: I provided the newsgroup with information about MY experiences with
: that amp..

tainted...

: They can make up their own minds now that they have read about my experiences
: and about your experiences with the same amp...

True... and my reasons for dispelling your statements.

:> : It is very common for cars to be designed using 4 wheels, but there is
:> : a big difference between a Corvette and a Chevette.
:>
:> Most lower priced smaller cars do run well when you drive them off the
:> lot. After years of travel, my 1953 Buick still runs great with the
:> original Straight 8 ("mechanical inverter"). I just don't try to drive it
:> 100mph plus.

: Then don't try to keep up with my 50 chevy business 'bubble' coupe
: with it's Blue Flame 6!

I'm not racing anywhere in a 53 buick... you can't see the pretty girls
well at 100mph.

:> : But if I remember correctly, the antenna switching relay they used in
:> : that amp had 15 or 20 amp contacts on it.
:>
:> Those are probably the low frequency AC values. Your results at 30MHz
:> can and will be different.

: I was using the extra contact or the feedback contact, or I would parallel BOTH
: if they were available, to switch the current to the DC to,DC converter.
: That way I did not have to install another relay.

: I could not do that in all the amps because some had smaller relay contacts in
: them, but I would say that in about 25% of the amps I was able to do that and it
: worked just fine.
: There may have been some small power loss due to the relay contact resistance,
: but not enough to notice.

Over time that much current through those contacts will cause them to
fail, it would have been more practical to do other things for the long
term.

:> :> Tripplite has similar designs in many of their line of dc to ac
:> :> inverters.
:> : I would not know because I have never repaired a Tripp Lite DC to AC
:> : inverter.
:> : (I have repaired some of their high current power supplies and was not
:> : really impressed.)
:> I've done more than my share of them... I'm not impressed myself, but I
:> have and use them when I want too.

: Good for you!

Same theory, similar circuits, similar parts, similar heat...

:> : Hopefully they have much more heatsink area per watt of delivered
:> : output than the Kris had.
:> Remember your taking a different era here... Sure If I wanted more for
:> less, I'll hook up a solid state amplifier. But it's not as much fun as
:> it doesn't whine when you key your radio. Sometimes it's not about what
:> is best, it's about what you do for the fun of it...

: I have similar interests.

Thats a good indication you have blood flowing...

:> I would have replaced the transistors with NOS or surplus units.
: I did that, and it did not fix the problem.

Or, you didn't find or fix all the problems.

:> I just did a Sonar last night for the same problem you describe.
: Did it blow itself up AFTER the owner turned it off?

I wasn't there when it went poof...

:> Not rocket science and the Sonar also lacks any large hunk of heat sinks in place for
:> long duty cycle operations.

: I agree, but when I was repairing BR-2906's, I know for a fact that
: there was a separate relay (K2) in series with the converter circuit
: because I had to replace a few.
: I'm not sure about the BR-21's.

I crossed the 21 base unit label with two tube mobile version you mention
might be the 2906. I've got one on my bench right now... as I mentioned,
I've reverse engineered the circuit, there is no DC relay path switching
the DC supply to the transistor emitter or collector leads. Same as the
Kris, the feedback section supply is switched on and off.

:> : With the relay solution, the customer could put the same amp back into the same
:> : place in his mobile and run it exactly the same way he did before and never have
:> : it 'melt down' again.
:>
:> A good set of transistors as installed should do the same thing,
: It should have, but it didn't!

Look for other problem sources... I did and that's how I came up with a
few upgrades and proceedures I place in every repair as required. Cheap
inssurance, often less than a buck in parts.

:> :> What do you throw out as a
:> :> good icas amplifier, made that period of time in a similar price / clase
:> :> range..?
:> : The HYGAIN amplifiers.
:>
:> They are nice amplifiers, but they do reduce their tube lives much quicker
:> than many amplifiers.

: Why? The amplifier HEAD unit is identical in design to the Kris and the Sonar
: amps..

They tend to push the tube rattings in transmit mode, plus the heater
voltage is really high...

:> They are not ICAS amplifers and will melt down under
:> long keydown conditions.

: So you are saying that they had shorter keydown times than then Kris?

Never bothered to compare their keydown times in original form. I like to
stay conservative.

: What do you use as the definition of ICAS?

duty cycle

:> They have a very similar inverter circuit.
: They had much more heatsink area per watt than the Kris had, so I
: never had any self destruct AFTER their owners had turned them off.

I've done a few dead amplifiers of most every brand sold... the force is
strong yoda...

: Initially they had a similar inverter circuit (in the 400 series amps), but by
: the time they were building the 600 series amps (the FOOT LOCKER AMPS) they had
: upgraded the design to use a large relay to switch the DC path to the inverter.

All were designed with cost and volume in mind...

: I could have named many others, like Astro, Apollo, ABC, Black Cat, Contex,
: D&A, Kicker, Layfayette, Lincoln, Tranzel, Maco, Palomar, SOS, Varmint, etc..,
: who ALL switched the DC power to the switching transistors in the DC to DC
: converter circuit, but I did not mention them because they were not FCC type
: accepted.

Think again maestro, I've worked on most and have many of the above
amplifiers you list above. Most all the mobile versions dont bother to
switch the DC supply, just the inverter feedback path. It was a common
design that everyone used.

:> :> I have two Sonars in for repair right now, I've reversed engineered the
:> :> circuit and the Kris is a very similar design. Almost all the problems
:> :> I've ever repaired with these type of classic designs have been operator
:> :> caused. The BR-21 on my bench right now has failed transistors and
:> :> more...
:> : Why bother?
:> Because some people enjoy operating old equipment, myself included. I
:> prefer to leave larger/fast amplifiers on the shelf and operate for the
:> fun, that's what radio is about.
: OK.

Change that from the base 21 to the mobile version label. I've got one or
more of both anyway...

:> : The Germanium power transistors for the DC to DC converter plus the high price
:> : of replacement tubes would cost much more than some of the new solid state RF
:> : amplifier transistors, (like the 2SC2879's) and a pair of them will put out a
:> : lot more power with more efficiency than that old tube amp ever will.
:> I get them surplus for free or cheap... Forget your crappy 2SC2879's...
:> If your going to blow your own horn, try some fets instead.

: I can't get as much power per dollar with FETS.
: When I can, I will go that route.

They your not doing something right... current technology makes fets an
excellent dollar per watt value for amplifier work.

:> But I supply the facts and supporting evidence here, not just throwing out
:> slams against equipment without knowing the circuit in detail.
: That is your opinion, not mine.

and it's right... hey...

:> : My ego is doing just fine thank you, so I don't feel a need to resort
:> : to any derogatory verbiage here.

:> Your getting better... at least no personal slams made it out this time
:> D. I'm impressed with that part.

: Thank you.

there is light at the end of this tunnel..

:> My ego is in check for the moment, just
:> don't trash an amplifier close to my heart unless your willing to debate
:> the issues.
: I'm willing to debate the issues, but have very little free time available to
: debate them.
: So I hope this is the last post I will have to make on this subject.
: Regards,
: Dennis O.

I doubt that the FCC will ever pass regulations restricting what home
owner's associations and such can do with antennas other than those for
television and satellite reception.
If you are a ham or CB radio operator and you sign one of those restrictive
covenants you get what you deserve. You agree to the restrictions, it is a
legally binding contract and you are stuck.

The "best" as far as CB is concerned depends on the distance and nothing else since you are in a very narrow frequency range. If your run is going to less than 100 feet use RG8/u. Don't spend your money on anything else, you would be wasting money. For runs less than 500 feet you should use 9913. Don't be fooled by the so called "flexible 9913" it isn't THAT flexible. For a beam antenna you can use the 9913 up to the base of the rotor and use RG8x for the last few feet. I'm using that with a tri-band yagi and it works great.

About the time I got out of repeaters the 'courtesy beep' was born. It indicates the reset of the timer and is delayed to allow new people to beat the quick-thumbs. It also drives anyone monitoring to the booby hatch.

The way you stop the quick thumbs is to trigger the id'er from the reset pulse thru diodes and ground the middle of the diodes via the ID timer until it is time to roar. Then at the end of a transmission the IDer comes up with about 20wpm of square wave audio that sends the limiter into convulsions and buries the quick thumbers for the four seconds or so it takes to ID. Whack! across the side of the head, he said educationally.

Gary, like so many other things, the Amateur community taught the CBers all our bad habits -- in this case with some help from the Browning Golden Eagle. So now we have the roger beep and various models that do everything short of play the Half-Fast Waltz.

I, as well, am amazed it works. HI

Dick NBK

The DSP aspects are new, so new that they fall into the great category of
things that almost work. Nothing that maps good-bad onto new-old, a lot
of old ideas become possible with later technology. When Armstrong
invented FM it was not possible so PM with the 6db per octave rising audio
was the standard. When 'true FM' became possible it was found that PM
worked better so that now when most of it is done 'true FM' the audio
preemphasis has to be added.

If the cell jocks can do it, more power to them.

Dick

Just in case you can't get that news group here is some more info below:

Guides for Creating Newsgroups

Index:
Guide for Creating a Big Eight or Local Newsgroup
Guide for Creating an alt.newsgroup
Home

Greetings,

The guides below should answer most, if not all, of your questions about
newsgroup creation. The heart of the guide is the standard FAQ's and where
they
can be found.The guides attempts to fill in spots where the FAQ's are vague.

The alt. And, so called, big eight newsgroups, are international in scope.
They
should not be used if the subject is of local interest only. An example
would be
a newsgroup about the lakes near Austin, Texas. Such a newsgroup should be
created under the austin.* hierarchy. Alt. newsgroups are simple to create
and
require only that you place a proposal in the newsgroup alt.config for
critique.
After that, if you have satisfied all valid objections, you can send the
newgroup.control post to create the group. The second guide pasted
below covers the creation of an alt. newsgroup in detail.

A proposed big eight newsgroup must complete a process of review,
discussion,
(RFD or Request for Discussion), and voting. (CFV or Call for Votes.) The
process is long. Usually three months or more. The process is started by
sending
an outline, of your proposed newsgroup, to group-mentors@acpub.duke.edu. A
proposed new newsgroup must gather one hundred yes votes more than no votes

and
the yes votes must be two thirds, of the total votes. The process is run by appointed mentors. The process, with examples, are thoroughly covered in the FAQ's listed in the guide and requires no further explanation.

The reward for following the more involved big eight process is assured distribution of your newsgroup worldwide. The alt. newsgroup may, or may not, be
accepted by Usenet news servers.

Local, regional and national newsgroup hierarchies have their own requirements
and must be contacted for those requirements.

There is also a hierarchy called the free.* hierarchy which only requires that
you send a properly configured control.newgroup message. You can find instructions on creating a free.* hierarchy newsgroup by clicking here. .

Please keep in mind that once any newsgroup is created the group is not yours.
It is in the public domain and you have little, or no, control over it.

Guide for Creating a Big Eight or Local Newsgroup

Revised 28 January 2000
Creating newsgroups for the comp., humanities., misc., news., rec., sci., soc.
or talk. hierarchies, the big eight, is somewhat complicated but has mentors to
guide you through the process.

A proposed big eight newsgroup must complete a process of review, discussion,
(RFD or Request for Discussion), and voting. (CFV or Call for Votes.) The process is long. Usually three months or more. The process is started by sending
an outline, of your proposed newsgroup, to group-mentors@acpub.duke.edu. A proposed new newsgroup must gather one hundred yes votes more than no votes and
the yes votes must be two thirds, of the total votes. The process is run by appointed mentors. The process, with examples, are thoroughly covered in the FAQ's listed in the guide and requires no further explanation.

For information on starting a big eight newsgroup read the following documents.

http://cs1.presby.edu/~jtbell/usenet/newgroup/how-submit.faq
http://cs1.presby.edu/~jtbell/usenet/newgroup/good-proposal.faq
http://www.faqs.org/usenet/alt/naming.html

For information on starting a moderated newsgroup read the following documents.

http://www.swcp.com/~dmckeon/mod-faq.html
ftp://rtfm.mit.edu/pub/usenet/news.answers/news/moderated-ng-faq

For information on starting a local, regional or national hierarchy newsgroup locate that groups config, or general, newsgroup. (Example: austin.usenet.config). I have found that at times you will not be able to obtain such information from the newsgroups. You should then contact your Internet Service Provider (ISP) and try to obtain such information, or advice, from the system administrator.

If all attempts to obtain the procedures for creating a newsgroup, in the hierarchy, have failed go ahead and sent the newgroup control message. You can do no harm. The newgroup control message will either be accepted or rejected by the system administrators.
(You may also then receive the information you were seeking along with other suggestions :-)

Guide for Creating an alt. newsgroup

Index:

First things first:
More useful information:
Information for starting a moderated newsgroup:
An Overview:
Creating your newsgroup:
Newsreaders That Will Send a Newgroup Control Message:
An example, newgroup control post , header and body:
Follow Up:

First things first:

Download, print out, make a file, and read the following.
(Very important)

http://www.faqs.org/usenet/alt/naming.html
http://www.gweep.bc.ca/~edmonds/usenet/good-newgroup.html
http://www.visi.com/~barr/alt-creation-guide.html
http://www.faqs.org/usenet/alt/example.html (the template)

More useful information:

http://www.faqs.org/faqs/alt-creation-guide/
http://www.geocities.com/ResearchTriangle/Lab/6882/ncreate.html

Information for starting a moderated newsgroup:

ftp://rtfm.mit.edu/pub/usenet/alt.config
ftp://rtfm.mit.edu/pub/usenet/news.answers/news/moderated-ng-faq

An Overview:

NO ONE can keep you from creating an alt. newsgroup.
NO ONE can make a Internet Service Provider (ISP) put your group on their Usenet
news server.

NO ONE can effectively remove your group, except the Internet service provider,
and then only from his server. Most servers automatically reject rmgroup messages.

Creating a successful alt. hierarchy newsgroup will take about four-weeks. Distribution over the usenet system, once created, may take a month or more.

There are no votes needed for alt.* newsgroups. A charter is not required but
you should provide a description of the groups purpose.

A format familiar to system administrators should be used so that they can quickly determine if it is of interest to their operation. (That is the purpose
of following the template format you downloaded.)

Justification for the group should explain why it is needed. A large mailing list and frequent discussion of your newsgroup subject in other newsgroups should be mentioned.

Post supporting your proposal should be sent to your e-mail address. NOT alt.config. You can summarize the messages of support in the justification portion of the control message. In your control.newgroup message you should mention that the newsgroup was proposed and discussed in alt.config, giving the
date (and ideally the Message-ID) of the proposal. This information should appear early in the message since many news administrators, will ignore any newgroup messages that don't mention alt.config in the first page. (I suggest
putting the information in the comments portion, in the body, and the summary
field of the header.)

The biggest obstacle you will have to overcome is getting the Internet service
provider, systems administrator, to allow your newsgroup on their news server.
Good propagation is second, in importance, only to the creation of your newsgroup and is more difficult to obtain. If your creation is on one or two news servers, out of several thousand, your creation will fail. That is why following the documents (FAQ's), while writing the proposal, control and booster post, is important.

Creating your newsgroup:

The group you want to create may already exist. Download and check ftp://ftp.isc.org/pub/usenet/CONFIG/newsgroups . This will give you a complete
list of alt. newsgroups, and hierarchies, in existence; not necessarily in use.
The list will help you name and place your newsgroup in the proper hierarchy.

(very important)

Creating a newsgroup essentially involves three stages. Writing a proposal which
will be posted to alt.config for discussion. Writing a control.newgroup message
which is the same as the proposal except it has control: and approved: fields in
the header. Writing booster post after the newsgroup is created. The booster is
exactly the same as the control post except at the beginning of the message, in
the body, after a blank line, the word "booster" is written. Control and booster
post are cross-posted to alt.config and the newsgroup you are creating.
(alt.config,alt.group-name)(Just a comma, no space, between the two.)

The best source of information, concerning the creation of an alt. Newsgroup, is
contained in a document titled "How To Write a Good Newsgroup Message" by Mr.
Brian Edmonds. It can be found at URL
http://www.gweep.bc.ca/~edmonds/usenet/good-newgroup.html . Pay particular
attention to his "must", "should" and "should not" instructions. The document by
Mr. David Barr is also strongly recommended; especially the part about newsgroup
naming conventions. It can be found at the web URL address
http://www.visi.com/~barr/alt-creation-guide.html

When you prepare your newsgroup proposal try to keep the discussion of the
proposal too one screen if possible. A long proposal may not be read. Use the
comments, charter and justification sections of the template example, below, as
a guide. Let your proposal stay on alt.config, for discussion, about a week.
There may be suggestions for changes. Consider the suggestions carefully. If
there are no suggestions you can assume the proposal is acceptable. Then,
incorporating any changes, you deem necessary, send your control.newgroup post.

Cross post your control.newgroup post to alt.config and the group being
creating. Only a comma between the two; no space. (alt.config,alt.group-name) A
successful control.newgroup post WILL NOT show up in alt.config even though it
was addressed to that group. The CONTROL newsgroup (it may be listed as
control.newgroup on your ISP's server) is where you will find your
control.newgroup message, if the post was successful. Look in the control
newsgroup and see if the group was created. There may be 40,000, or more, post

in control so It may be hard to locate. Use the find tool and If your newsreader
has a filter (kill file) you might filter out the word "cancel" too get rid of
most post that are of no interest too you. Sorting the group by subject also helps.

Every Internet service provider that accepts control.newgroup post automatically
will create your group on that server immediately when received. The
control.newgroup post will be passed on to the system administrator for action
if not created automatically. Many sites will not add your group unless
requested by one of their customers.

Newsreaders That Will Send a Control.newgroup Message:

What none of the FAQ's make clear is that your newsreader may not have the special header fields needed to send a control post or how to get those header
fields. There MUST be "control:" and "approved:" fields IN the header. Free Agent, Agent, and Netscape's Messenger newsreaders can produce these header fields for IBM type PC users. For Macintosh users the MT-Newswatcher can be used. All the suggested newsreaders are freeware and can be found at the URL's
following.....

Windows 95/98 and Windows 3.x
http://www.forteinc.com/agent/freagent.htm

Macintosh
http://ev1.mac.tucows.com/preview/2448.html

The MT-Newswatcher (Macintosh)

To configure the MT-Newswatcher perform the following.

From the menu
click on FILE
click on PREFERENCES
Scroll down to Extra header lines
Type in control:
Type in approved:
Click OKAY

For MT-NewsWatcher 3.0 version the following change.
In recent versions, you edit the headers in Personalities... under
the Special menu, or in the "Extra News Headers" tab in the "New Posting" window.

The Free Agent Newsreader
(Agent is essentially the same)
To obtain the required headers with Free Agent you must find the agent.ini

file
("agent configure" with windows 95 or just
agent).

(Easy way to find the file is to use the find program.
Click the START button in the lower left hand corner of the screen.
Go up to FIND and over to and click FILES AND FOLDERS.
In the box that opens enter AGENT.INI in the NAMED field.
Click the FIND NOW button and it will find the AGENT.INI file for you.
click on the icon and it will open the file for you to make corrections.)

Open the file by clicking on the icon and using notepad or wordpad.
Find the section labeled [message] and then find ShowAllFields=0.

(again you can find the item easily using the FIND function of notepad)

Change ShowAllFields=0 to ShowAllFields=1. Save and Close the file.
Close and restart Free Agent.
Click Post on the menu.
Click New Usenet Message.
Click message on the menu
Click on All Fields. (An icon at the top of the newsreader)
The last action will open a new fields box. In this new box you will find
the
new control: and approved: headers. You can scroll the fields using the
buttons
on the right side of the box. To enter data in the control field highlight
the
control field by clicking on it. Below the box you will see another box now
marked as Value for control. In this box enter the control data. Click on
the
highlighted control again and the data in the value box will be transferred
to
the highlighted control field. Repeat the operation for the approved field
and
all fields you wish to change in the box.

An example, control.newgroup post , header and body.

============ template example below ================

From: {email address of person sending this message}
Newsgroups: alt.config,{name of newsgroup being created}
Control: newgroup {name of newsgroup being created}
Subject: cmsg newgroup {name of newsgroup being created}
Summary: discussed in alt.config, substantial interest, appropriate name
Expires: {this should be left empty, in a newgroup message}
Approved: {email address of person sending this message}
Sender: {email address of person or administrator sending this message}
Follow up-To: poster {follow ups default to emailing you, instead of
posting}
Reply-To: {email address of person requesting creation of the group}

Distribution: {this header should be empty except for a single space
character;
especially don't use "Distribution: world"}
Organization: {your organization or institution may be named here}
Keywords: {here you may include keywords related to the topic of the group}
Cc: {you may specify email addresses to send a copy of this message to}

(make sure you have a blank line here, between the header, above, and the
body,
below)

Comments:
State the dates (e.g. "during 1/96") was discussed in alt.config, and who
you
are in relation to the proposal (especially if you aren't the original
proponent). Many news administrators, will ignore any newgroup messages that
don't mention the posting of the proposal to alt.config.)

For your newsgroups file:
newsgroup name [TAB]A few words describing the newsgroup. One line. Do not
run
over.

(You must follow the format above exactly; copy the first line verbatim, and
on
the second line give the name of the newsgroup, followed by one or more
spaces/tabs followed by a few words describing the group. The first
character of
the description should be an upcase character and the line should end with a
period (dot). Do not run over the end of the line!) Limit the entire line to
eighty characters, including spaces/tabs and period.

Charter:
The purpose of the charter is to define what topics are (or are not)
appropriate
for the newsgroup, and to state any applicable policies of the newsgroup
(for
example, if the group is "retro-moderated", you should explain the criteria
that
will be applied by the moderator or moderation software.

Justification of Readership:
Here you should include numerical evidence that there is substantial online
interest in the topic of the newsgroup. If the topic is covered by an
existing
newsgroup, mailing list, or other discussion forum, you should also explain
why
the existing forum is no longer adequate for the purpose.

This also applies to creating a specialized subgroup of a more general
newsgroup; you will need to explain why the split is necessary ("we don't
want

to use the general group" is not considered an adequate reason-- only a high volume of traffic in the general group, and/or a high percentage of that traffic
being on this specific sub-topic, is considered a valid justification for a split).

==========template example above ==========

Always remember; You are addressing systems administrators with your proposal,
control and booster post. They must make quick decisions on your newsgroup along
with many others.

Follow Up:

You have done all the above and you still do not see your newsgroup on the server of your ISP. Check for newgroups or refresh your newsreader newsgroup list and check again. If it still is not there after a day or two give your Internet service provider a call, e-mail, and request that it be added.

To get good distribution of the newsgroup encourage all, who may be interested,
to ask their Internet service provider to add the group to their server. (A polite announcement, of the creation of your newsgroup, to newsgroups with similar, but specialized interest, would not be out of order.) Send a booster
post after about two weeks; After that, once every six months to a year. Boosters are important since the Usenet is not static. New ISP's are being created, failing and changing constantly.

This guide can be found on the web page at
http://www.geocities.com/eacalame/create/create.html which will have hyperlinks
to more references .

Have fun.

> At this time, the FCC is not extending protection to other types of antennas,
> such as Amateur, CB, GMRS, etc.

.....but they damn well should. What's the deal with moving into an area with restrictive covenants? Do you have to sign the contract to agree to it or is it just one of those things that you have to agree to no matter what? There are some of us that have no choice, however, and must live under these restrictions. I don't care about legal contracts or what have you I want to know why it is someone else's business what I choose to put on my own friggin' house. Goddamned covenant nazis.

3239. 11/10 back to 6 meter conversion for amp?

Newsgroup: rec.radio.cb

I have this old sweep tube Fist brand linear amplifier. It says 6 meter on the front and I have been told that these old amps doubled as six meter boxes that were easily converted to 11 or 10 meters. I was given this thing as a gift and have no way to test what freq. it works on. The coil tap on the inside looks like it has been moved. There is a little bit of solder on one place on the coil. So should I move the tap back over so I can use this amp on 6 meters? Does anyone have one of these amps and maybe knows a little bit more about it than I do, perhaps you have a schematic? This is a neat looking little amp and hey it was free so I don't want to let it go to waste. I am getting a low power 6 meter rig and might want to use this in my shack. Any help is appreciated, any flames are ignored. Thanks for your time and 73!!

PB.

Message-ID: <3ACE58D1.EA152C99@home.com>
Source record: 77818

I'll attempt a non legaleezed explanation. Deed restrictions and covenants, called different things in different states, are normally attached to the property title by the original developer or owner. It could be something like the farmer who first owned the land in the 1840's didn't like alcohol, so he could specify that anyone who owned the land could not drink. Most local governments do not attempt to enforce these restrictions. It is a civil matter between the land owner and adjacent land owners who might choose to enforce the covenants in court. If you purchase a home with deed restrictions and no association exists, it is unlikely that they will be enforced. If the home has existed for some time and other residents in the area have obvious violations, all the less likely that any restriction will be enforced. A single neighbor can enforce a restriction but it tends to be expensive, so associations more often than not are the ones to make the legal attack. The sales guys should knolw about restrictions and make the potential buyer aware of them, but often they don't. Several years ago, a friend of mine decided to buy two houses-one for himself and his family, and the other for his parents who were aging and needed some attention but not enough to go to the group home. They were strictly custom homes in a very nice area. No mention of restrictions, and the question came up. He knew to ask. At closing, the paperwork was being passed back and forth and then out it came, the volume of restrictions. Oh, just sign here. Nope. The deal stopped right there. Losts of ranting on the part of the builder who now had two specs with unusual design details. They had some really interesting covenants there too. The association could come into the home to verify that the garbage disposal was functioning properly. Garage door couldn't be left open. Trim paint on the facia had to be approved. It was a volume. Most people are at a point in their lives at that moment that they don't have a choice. Perhaps have already sold the old house and have to be out in a couple weeks. Wife is sitting there with doe eyes, saying the wallpaper is perfect---people get suckered into buying into restricted neighborhoods.

With the cb crowd it isn't about communicating, it is a very juvenile thing about being the loudest on the channel so no one else can communicate.

Comparing apples to oranges is not going to convince anyone that your points have any meaning. Try the same thing on 10 meters, and see what type of range you get. I guarantee that you will not get the same propogation ranges.

Yes, there is an overemphasis on power - including among many Hams. But sometimes high power is necessary - even with an excellent antenna system. This is especially true where you have skip communications, where there tends to be a lot of signal attenuation with every bounce.

As an example: When I had my novice ticket, I once was trying to work an Australian station with 25 watts. He could not read me very well, so I had to repeat a lot. I cranked the power up to the maximum 100 watts the rig would manage, and he had 100% copy. That 6 dB difference made all the difference between a difficult/impossible QSO and one that was easy.

>1010.

If I remember correctly, the Eagle is a 10 meter radio and the AH-100 is a CB.
While they appear to be identical, I think they cover different freq's.

The truth is, there ARE no "unallocated" frequencies between 27.405 and 28.000 MHZ. There is a great difference between hobby and professional communications. The biggest difference is that *hobby* communications is, basically, talking for the SAKE of talking, professional communications is done in support of another objective, either military or business. Therefore, professional communications is done as briefly, concisely, and to-the-point as possible. It then follows that just because you don't HEAR someone jabbering away on a given frequency, is no indication that that frequency is neither allocated, used, nor needed by another service. For example, listen to the local police department. Their comms are right to the point and, usually, brief. If there are no calls coming in, the frequency will be rather quiet. Does that mean it is ok to jump onto 155.XXX MHZ or 453.XXX MHZ and just start talking because you want to jabber away? Of course not.

Finally, some frequencies aren't authorized for talking--they are used as buffers or "guard" bands between services. This is, as the names imply, to prevent interference between radio services.

>
> C. under 500 watts.
>
> D. under 1000 watts.
>
> E. over 1000 watts.

The great debate over power in the CB bands. One has to start at the beginning. We all know that the CB service was designed to give local families, and even businesses, a short ranged, low powered radio

service. Why was it put in 11 meters and restricted to 5 watts input? It has been explained here before that in 1958, UHF technology was in its infancy and VERY expensive. In fact, it had already been tried. The designers were not unaware of the propagation on 27 MHZ, and they DID know that atmospherics could play havoc with communications. BUT ,by limiting power to 4-5 watts, locals could overcome "skip", and not be cut out by faraway signals. Another factor was the general public attitude that existed in that time; they were much more likely to abide by regulations and laws. FCC, at that time, therefore, could not forsee the CB "boom" of the '70s, nor could they know that a time would come when people would ignore said regulations and just do as they please. The truth is, high powered amps on CB DO do harm. Again, another characteristic of 27 MHZ is "one-way" "skip". There may be a 4 watt station just trying to talk to his wife from his mobile, but there is a 1000 watt station just booming in covering him up. The kilowatt station can't hear the low powered mobile, so the poor guy gets covered. What's fair about that? When you have 100 1 kilowatt stations trying to talk at the same time, it DOES create interference and NOISE--maybe not to YOU, but somewhere someone's message is not getting through. THAT is the reason for the restrictions! The more power bouncing around the ether, the more potential for interference. The other reason is that the CB service was built for Mr. Average Joe--the guy that *may* not know much about radio, electronics, and/or why things act as they do. Sure, maybe *YOU* DO know what you are doing. BUT, with something designed for and as a CONSUMER product, there has to be control in order for that service, as well as OTHER services that use the spectrum to have the maximum utilization and/or enjoyment of same.

And that, basically, is the way it is.

Hi all, I recently got my hands on an eagle tomahawk, does not work right. I think it is something stupid myself, but I have gone all through it, I see some things wrong with it but fixed them all and very little improvement. Also, I don't know what this radio is excatly, if it a CB? or 10 meter radio? how amny wats? If anyone can help, or knows of a place that might be willing to look at it for me I would really apreciate it. I like picking these things up not working, fixing them and then selling them and some one told me I couldn't fix this one, big mistake, it will be fixed. Please email me if you can help, not to the news group, I have a very busy weekend coming up and would much rather go through email then look in a news group. Thanks

Source record: 77831

Like Doc, I am not entirely certain you have framed the question realistically.

1) Freebanding at one time meant FT-101s with a shortage of brown wire. And it generally was kept in the range below 28 in SSB by a group that largely wandered into radio by an odd path. Have many friends and many more licenses in the group, and that from the 13wpm days. FWIW I have never strayed off the Amateur reservation.

Today it tends to be crap radios with opened PLLs running Ancient Mary (nothing against the mode, it is just dangerous in the hands of the incompetent) by people with head problems.

I am afraid that your definition is something of a nostalgia trip. Even in the 70s I was and am a bit more sympathetic than most to the desire for the 'clear channel', the 'private channel' etc. but tend to draw the line at outlawry for its own sake. And as was once observed, ignorance is curable but stupidity lasts forever.

The ethics and morality of freebanding have more to do with the motivation and method than the act itself.

2. There are a number of theories about the 4-5 watt limit but I tend to think it had more to do with video i.f.s at 25.75 MHz. Ten meter amateur practice mobile, the old Gooney boxes, was 25-35 watts. Five is a bit lite, 100 a bit much but 25-50 does not seem unreasonable. Again, most of the splatter boxes are for Antique Modulation.

Hello Gary: Excellent post Gary. I'll buy ya one for this.

Before I moved into my home about 4 years ago, I looked over the neighborhood, and documented all the ham, CB, and other antenna installations. I also documented all other usually type violations. I borrowed cars to drive around to photograph all of it.

As I made a offer to the Real estate guy (fuck you, pay me guy) I demanded to see the current deed restrictions. The Escrow people did not want to supply a copy of the deed restrictions. I told the Real Estate guy "fuck you" deal is off!!!!! I truly enjoyed telling the Real Estate guy this, since I wasn't in desperate need to half to move.

Now mind you I went into this deal like a coiled rattle snake, I had time and money on my side. The owners of the house wanted out desperately and I didn't "need" to do anything. A very good point Gary made was people being suckered into agreeing to the restrictions at the closing of Escrow, BRAVO Gary!

The story continues and the plot thickens.....

The Escrow people and the present owners finally came up with a mimeographed very old looking list of deed restrictions. It included restrictions on sheep, cattle, no stills in the front yard, no Asians, or black people allowed in the area after dark, and many other obvious illegal, unenforceable crap. I fired this copy to my attorney, old grumpy guy, former police officer, judge, and city councilman, and all round neat guy.

Mr. Attorney said: (after I paid him $300 dollars) that the deed restriction document was a joke, and not a real legal document. And that he thinks there is a real deed restriction document, and that the folks at the city office would have the real deal. And that the Escrow people are in trouble, legal wise if there are saying this is the real deed restrictions. I had Mr. Attorney call the Escrow people, and my Real Estate guy, Wooooow what a great thing to do!

A little background here, I have now contacted the local home owners association, and received the updated deed restrictions, and talked with them, about any legal enforcement, existing antenna installations, and what they all where looking for. They did not care about antennas, stills, asian or black people, but did care about cattle, sheep, starting a wrecking yard, or sub dividing up your desert lot, and putting more homes on the lots. No a problem for me.

The Escrow people now say they never supplied anyone with deed restrictions, and had their attorney will contact my attorney, and would

have him supply the deed restrictions. Well the attorneys copy now matched mine, ain't that ah coinstance! You betcha, they are out there to take ya. Mr. Real Estate and Mr. Escrow guy a lot of times aren't on anybody's side but there own! "BE ADVISED" It is advisable to have your old crusty grumpy attorney present at the closing of Escrow, if you are concerned about such things. I had a ball at my closing, another story.....

But as Gary said, people are suckered into signing the deed restrictions, in the heat of closing the deal. The ARRL is slow to reply, but there are ways of side stepping these restrictions. The ARRL has a form that I believe allows you to bypass the restrictions for your ham radio antennas, by you not agreeing to the restrictions. Please someone set me straight if I am wrong here. But I didn't half to worry about the deed restrictions in my location, they didn't talk about antennas. But people here are held to the building code for antennas over 40 feet in height, needing a building permit. But I did contact the ARRL and there is a form, and possible a procedure. Again I didn't half to go into it.

Closing statements:
The world of deed restrictions, and the guy who whats to put up a few antennas, is a crap shoot all the way. No two neighbor hoods are the same.

I suggest before you move in, take the time and money to figure it all out. Some places have deed restrictions that do not allow any antennas, but there are all kinds of ham, CB, commercial band, and even telephone poles holding up all kinds of other things in such neighborhoods. But the home owners association is not organized, or unwilling to come up with any money to go to court.

Other places are bunch of tight ass goof's ready to pounce on anyone that does not conform to being a lead by the nose. I'll bet one group still has night mires over me, buts thats another story.....

Buy looking into the "deed restriction" bull, espically ahead of time, one can save a lot of time and money. Time well spent!

3264. Cheap Radio, better or worse? Please Help!

Newsgroup: rec.radio.cb
Date: 2001-04-07 04:55:25 UTC
From: "Brian P. Melius" <BrianM82@Toughguy.net>
Message-ID: <tct7gp6r2jta1b@corp.supernews.com>
Source record: 77839

Hi-
I recently bought a cheap 55 dollar cobra radio from the TA here and I was wondering if it was worth it. He got a cheap antenna, and we've fried two radios in the past two days. I direct wired his just like I did mine and it worked for a bit, then the fuse gets red hot (you can see it glowing through the plastic on the inline fuse thing) and it blows. We replaced the fuses and that didn't work. We also replaced the direct line with a cigarette plug and that also produced the same results. We ended up putting higher amp fuses in the radio (5 amps) and then it started to burn it up. I don't think the problem is with my hookup, but I don't want to say that its not since that brand did the same thing on two different radios? Please reply if you can help. Thanks,
Brian Melius

My God are full of yourself or what.

Maybe you need to sit down and have a look at yourself.

Maybe its not the people on the radio it is YOU!!!!!!!!

If this is all you have to bitch about you really need to have a good
hard look at yourself.

At least in a dx contest, stations want not only to be heard above the rest of the crowd by the dx station, but they also want to hear the dx station for their report. Once the dx station acknowledges one station, the rest (for the most part) stand by until the two have exchanged reports. On cb the power station doesn't want to communicate with anyone and doesn't want anyone else to be able to communicate either. Very juvenile.

Hi, (or should I say break)?

As the subject line says, Rado Shacks (REALISTIC) TRC-216, 40-CHANNEL
CITIZENS BAND TRANSCEIVER.

I bought this CB new in 1987, and still use it every day.
I do get out on it.

MY question is to they still sell or make the mic for this unit? (I tried
Radio Shack), EXT MIC is a 5 hole din/pin?(HELP)!!.

Does anyone know where I can get one?. I was told I could use any mobile Mic
on this? (PLEASE HELP)?

NOTE I live in Toronto,Ontario Canada.
I'm a holder of a RADIO STATION LICENCE / GENERAL RADIO SERVICE. and I'm
authorized to establish and operate a GRS land or mobile station.
(CANADA) CALL SIGN is XM4138221 ...

Please reply to Newsgroup,as I read them every day.

Thank-You

A radio is only as good as it's antenna. Handheld devices are poor performers with the built in antenna. The only band where a small antenna is good is 800 Mhz. VHF & UHF can be used with a rubber ducky type antenna, however better reception can be achieved with a full size external unit tuned for the frequency of interest.

Handheld are useless on 27 MHz without an external antenna.

YES, You are not wanted or needed. We have plenty of good, honest Americans with no life or job on this NG that are already doing the same job you think you are doing. Go find some illegal Finns/Lapplanders to harrass. If CB is as bad as you seem to think it is, you will have no problem finding folks closer to home to lay your " I am better than you because I have a ham ticket" attitude on. BTW, I am a ham and can't stand that attitude from anyone. Last time I was home in Norway (Ain't dual citizenship great?) we heard plenty of illegal activity coming from the east and it wasn't in Swedish or Russian if you catch my drift. Fix the problems at home before you worry about the rest of the world. Why is it that that speech they call a language always sounds like the goal is to see who can bring up the biggest loogey? Go away Gary/Kari or whatever you call yourself this week, you are no longer needed. Especially with Comrade Erin Boobnervichsky back in circulation.

Along the lines of Big Brother, Comrade Scott, the same techniques that can determine the location of a 911 cellcall can also be used to deny service to for example, the County Jail, the local high school, or Rosie's House of Sin (if you're ever in the neighborhood, drop in). You might remember a thread on one of the amateur groups where a dear lady from El Ritzo Jr Hi was bleating mightily that her cellphone did not work at school. The assumption was made that it was being jammed. Not necessarily it would appear.

As you get thru the articles, see if any pertain to that kind of usage.

Beer Keg

KeyClowns Are Being Punished

Group: rec.radio.cb Date: Fri, Apr 6, 2001, 11:38pm (EDT-1) From: remailer@xganon.com (Public <Anonymous_Account>)

KeyClowns in this newsgroup are being punished, and it will never stop. Here's why.
We will never forget the threats made in this NG against N8 to

"Ahehehehehehheeeeeeeeeeeehaaaaaaaaaa! C'mon now. Want that girth smacked around, eh? Stop stuttering, and complete you sentences. Oh, that is correct, you can not, you are ate up with embarrassment and rage over your lack of takers with your phony posts to us. I know, you j-j-j-j-j-j-j-just can't help yourself! Now change your fecal stained panties, wipe the blood off of your nose, and roll over for a biscuit..aheeeehehehehehheeeeeeehahaahaha!
Ahahahahaahahhehehehehheeeeeeeeee! :)"

This message did not originate from the Sender address above. It was posted with the use of cowardizing blimpware. Remailers are worth nothing when used by sheer lunatic double digit hammies who follow me around hoping I will pass gas and give them token slaps, thereby giving them a glimmer of life.

Three lost dogs, last seen outside the play ground. Extremely rabid and noisy, does tricks for treats. Quiet only when they eat. Kicks to teeth and hind flank increases their hunger for other male dogs. Smell like skunks, appearance of rats, will run from water, truth, and direct confrontation. Tails are cropped and tucked firmly between legs. Will die without owner. If found, dogs will respond only to commands delivered with direct and intentional humiliation, or coaxed with treats (fecal matter and crow works best). Reward: Satisfaction in knowing the porn posting hammie of the midwest is getting outted.

Just FYI, this is the compliance statement from RF Electronics, a company that produces HF amplifier kits. They have been selling amp kits (and built ones) with very good feedback from customers as to the "cleanliness" of the amp (they run the amps close to class A). Anyway, this is what they say about the legality of selling amp kits:

****

FCC Compliance Statement

FCC rule 2.815(b): After APR 27, 1978, no person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease), or import, ship, or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency amplifier or amplifier kit capable of operation on any frequency or frequencies between 24 and 35 MHz.

FCC rule 2.815(d): The proscription in paragraph (b) of this section shall NOT apply to the marketing, as defined in paragraph (b) of this section, by a licensed amateur operator (Lee Martin/KD4YBC) to another licensed amateur radio operator (you/insert callsign) of an external radio frequency power amplifier fabricated in not more than one unit of the same model in a calendar year by that operator (you/insert callsign) provided the amplifier is for the amateur operator's personl use at his licensed amateur radio station and the requirements of rules 97.315 and 97.317 are met.

FCC rule 2.815(c): No person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease), or import, ship or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency amplifier or amplifier kit capable of operation on any frequency or frequencies below 144 MHz...

FCC rule 2.815(e): The proscription in paragraph (c) of this section shall NOT apply to the marketing, as defined in paragraph (b) of this section, by a licensed amateur operator (Lee Martin/KD4YBC) to another licensed amateur radio operator (you/insert callsign) of an external radio frequency power amplifier fabricated in not more than one unit of the same model in a calender year by that operator (you/insert callsign) provided the amplifier is for the amateur operator's personal use at his licensed amateur radio station and the requirements of rules 97.315 and 97.317 are met.

FCC rule 97.315(a): No more than 1 unit of 1 model and an external RF power amplifier capable of operation below 144 MHz may be constructed or modified during any calendar year by an amateur operator for use at a station without a grant of certification....

FCC rule 97.315(b): Any external RF power amplifier or external power amplifier kit (see rule 2.815) manufactured, imported or modified for use at a station or attached at any station must be certified for use in the amateur service in accordance with subpart J of part 2 of the FCC rules. This requirement does NOT apply if one or more of the following conditions are met: We meet the following condition: FCC rule 97.315(b.4) The amplifier is sold by an amateur operator (Lee Martin/KD4YBC) to another amateur operator (you/insert callsign) or to a dealer.

What does all of the above mean? Every licensed amateur operator may purchase or construct or modify 1 unit of 1 model of a non-certified RF power amplifier or RF power amplifier kit from another licensed amateur per calendar year for personal use at his station without a grant of certification.

"So far, it all appears innocuos. A few quick moves will reveal if the
above is true. I have my dubts, and here is why, read on."

I plan on signing up for the Master Degree program in Computer Science
with a focus on software engineering. I got

"Now. Does this hemorrhage of the language appear familar? Most college
grads acquire enough sense, especially in print, to say, "I RECEIVED, or
ACQUIRED. Let us move on."

a degree in computer science just for the fun of doing it. I like
playing with computers as a hobby so I figured if I want to learn
anything, mite

"Stop right there. All this alleged knowledge with horrible mistakes
like this? A mite, Mr. college grad, is a microscopic arachnid."

as well to it right,

"Aheheeheheh! See what it says? He says,
and I quoteth the college grad..'...so I figured if I want to learn
anything, mite (SIC) as well to it right." Is this unbelievable or not?"

and got a degree.

"Bam! What did I say about cutting your own throat, LELAND?"

****
I have found that ham radio is an interesting and fun hobby. Since my
professional background is in power electronics, I have found that ham
radio has provided me with a means to expand my knowledge in the area of
communication electronics.

"How about a return to basic prerequisites?"

Its interesting to note that most of the new technical advances being made in Ham Radio

"Tell us, oh college grad, why did you capitalize "ham radio?" Oh. I see. You carry the same reverence for it that you do myself."

occur on VHF and above. As an engineer

"Lalalalallalalalallallallala"

that is what attracts me to the hobby.
From where I stand I see systems that were completely designed in hardware now redesigned as part hardware and part software, which performs better and costs

"No sireeeBob. No Dewey button for you, no chest to pin it on. COST, as in SINGULAR! Even your average high school grad knows this."

less to manufacture. I think the time is approaching where it will be difficult to

"Retain your credibility, Leland?" No. Impossible. You are done.You can have this razor though to finish yourself off, Mr. tough guy."

separate
the hardware from the software functions in future communications equipment. Everywhere you look, commercial systems are going digital while many Amateurs are still arguing about the merits of Morse Code testing

"Need I say more? Yea! Actually, I have a command! Go IMMEDIATELY and fetch this wretched proof of your lack of intelligence and mushy gray matter off of QRZ.com and at least rework it so anyone with a sixth grade education can not come along and make a fool of you in front of the entire world etched in stone for all of history to see. And I just got down! Click click! :)"

Bingle, a bit thin-skinned aren't we? DX contests do about the same for me as they do you so I usually go fishing on contest weekends. The aspect of running power in the lo-VHF range that causes opinions like JR's, and mine to be honest, is that power is so blessed unnecessary. One of the reasons that the linear rules caused barely a rumble in Amateur circles is that they were rarely run on ten meters anyway. When the propagation gods are with you, the 10 db between 150 and 1500 PEP is irrelevant and when they are not, 15kw is not enough.

Out here in the mid-continent the most important DXing tool is a really good 2-4-6 filter, gets rid of New York, New Jersey, Florida, and California. Believe me, every beam in town is tuned for front-to-back, not forward gain. As JR points out, you can't work what you can't hear.

So yeah, we do tend to look at sheer power through the Amateur experience which might not be totally fair. When things like the antenna system and operator skill mean so much more than transmitting heat it is pretty reasonable to assume that when the first purchase is some honking piece of back-alley crap the buyer is more likely to be having manhood problems than DXing problems.

Kind of like Garrison Keilor's line about cell phones, they are not used for communication so much as announcing one's progress thru life.

How nice. The beginnning of your troll, anger, jealousy, hatred, and thread neatly rolled all in one."

There is an interesting article about the FCC's new DF stations in the April issue of QST starting on page 28. Seems like they busted several Freebanders, several High Power CB stations, and a few idiot Hams using the new equipment already. For the amplifier users and pirate CB operators on the news group it should be of interest.

Hello All:

Here is a site that has some great material on the deed restrictions and
all. Well worth the time spent to look it all over.

http://www.ac6v.com/newsletters.htm#CC&R

The gentleman at http://www.ac6v.com is a real neat guy and can help
you with some questions, he answered a few questions for me from e-mail.

Again check all this out before you move, I did and it really paid off.

If a few hours looking into all this stuff, and a visit to the attorneys
office will save you from going thru a big hassle, and maybe even moving
again $$$$$$$$$$$$$$$$$$$$$$$ Its a investment in being ah radio type
of guy.

So now that Leland has been exposed for the sleazy ass human piece of garbage we all knew he was anyway, maybe things can get back to semi-normal. Doug, no one holds a grudge. Get over it. A huge thanks to all you guys who helped out. Accusations of drugs, porn, forgery, libel, threats, x rated talk about family members, a homosexual addicted to porn, etc. My, my, my, Leland. I am glad as hell I ain't you. If the folks you accused of being thugs REALLY are thugs, I would seriously think about a Borneo address.

The NW is for people who cant memorize the location of their controls, they feel compelled to
check the SWR at 3am while navigating the Gorge at 70mph after a light rain (oops).
Besides it looks so cool lit up like that,dont miss that corner!!!!!!
The ST is feature is for communicating with your buddy who has a ST, it is not any good for any-
thing else. The only sound it tracks is from another ST. Dont even think about modifying a ST.
Stick with the tried and true 29LTD or GTL and you wont be dissapointed.

Read up, Tnom. "Ol Leland has been the keyclown foul mouthed poster that talked all the trash and forged all the names. Busted himself, I might add, with a little push from some anonymous donors. What a guy. Watch out. Said he'll spit in the face of anyone brave enough to show up at Dayton. Why go to Dayton when his addy is on QRZ? He made it EZ!

3315. CB vs. Ham...

Newsgroup: rec.radio.cb
Date: 2001-04-07 17:47:31 UTC
From: "Gary P. Harrelson" <GARYPHARRELSON@prodigy.net>
Message-ID: <9anjqb$2dbc$1@newssvr06-en0.news.prodigy.com>
Source record: 77690

Ladies and Gentlemen,

After reviewing the posts on this news group it would appear to me that there is a line drawn in the sand between amateur radio operators and citizen band radio operators. I am by no means an expert in either of these groups but belong to both. Before the FCC re-vamped the licensing structure and test requirements for amateur radio, I tested and passed all to become a licensed general operator and, believe it or not, passed the 20 words per minute exam as well. I was on my way to taking the last two written tests to become an extra operator. Before all of this studying and testing took place, I was very active in citizen band communications. In my experience dealing with Hams, most have at one time been very active in CB as well. What got me interested in the field of communications? Mr. KBJV 3385 (my Grandfather) did. What kind of call sign is that? A CB call sign for you young ones. He would go down into his basement when Grandma was getting on his nerves and he would fire up his old pre-Uniden President and shoot skip. Well, that's what he called it. I was hooked. By the time I bought my first car there was an old pre-Uniden President Andrew J. in it. Again for you young ones this was a standard 40 channel CB. Still have it in the attic along with my first HF rig, a Kenwood TS830S. What leads a CB'er to become a Ham? In my opinion, which isn't worth much, is to CQDX (shoot skip). There are some Ham's that deal with EME, or slow scan TV, or packet or whatever and I say good for them. There are some that love 2M repeaters and some that only transmit using CW. Again, good for them. What's legal, what's illegal, blah, blah, blah. I think everyone using this NG knows what is and what isn't. We really detest some self appointed, radio wave Nazi SS reiterating verbatim the entire rule book to us. I think common courtesy plays a big role when using an amplifier, as well as handling disputes as an adult with your peers. But, if pushed, most people push back. Quit pushing. Today's society tests the waters to see just how much they can get away with. It's a fact. Laws, rules, and regulations can be interpreted differently by different governing bodies. Rules are even bent to accommodate different people. The price of most amateur radios are astronomical. Point being, most regular folks could never afford those fancy big rigs. I say open all frequencies, except military bands, to the populous. The price for these rigs would literally deter most from ever getting on them. Cell phones, pagers, wireless internet appliances, today's technology is growing at an alarming rate. Let's grow with it. Without basement technicians working on equipment, we would never have evolved farther than the iron age. If you build it, they will come. Damn right. Is the government always right? Are we always right? Nope. Keep that in mind the next time you try to harm someone. I didn't want to use the phrase, "Can't we all just get along?" but there I did. Common courtesy, in my opinion is the most important thing mentioned in this message. One other

point before I post this and sit back and watch the replies come in, There is always another channel to go to. Pick one. Do you think that my four watt radio is going to compete on channel 6? Hell no. I choose another one to chat on.

Thanks.

3316. This one is for you, Kari

Newsgroup: rec.radio.cb

I have agreed to help coordinate several similar anti-keyclown factions
in this newsgroup.
Kari,

"So, you WERE aligned with him in this filth all along. Now your
countrymen see who was starting trouble, no? Your're welcome."

Doug, AntiKey, Leland, Sparky and others, please email me at this
address. Kari

"There's that name again....Kari. As an amateur radio operator, you are
a disgrace to your fellow operators in your homeland as well. And to
think the likes of you is teaching the youth of Finland. Well, they see
what their teacher is about now. Perhaps some school officials may
stumble onto this site and see how closely you aligned yourself with
this vile, rabid poster of pornographic garbage and the TRUE outlaw on
this ng. Would that not be a hoot? Now you know how Dennis felt when
your pal sent an email to his work. Do a google search on Kari's call.
All the information fit for print is there for the taking. "

has new info on some of the illegal businessmen in the 'rec-radio-cb'
group and we need to coordinate formal complaints to yahoo regarding
these.
NOTE: If anyone receives email threats from CB "gangsters", save them,
along
with as much header info as you can.
Also, the TwistedhedTweakers egroup has asked me to host the May 25th
meeting and we will fold those concerns into the previous issues and
make sure they get addressed.

=Punisher Of KeyClowns=

...has been assimilated.

An interesting view, Gary. I may not necessarily agree with all your points, but your intended message has been received loud and clear. Prepare yourself for some will pick this post apart on issues of legality vs. illegality. Those who can "see the forest through the trees" might appreciate "the big picture" you're attempting to illustrate. Others may simply label you a troll, it makes avoiding the issues easier. Overall a nice message. Take care and 73.

Mark

Graet piece of writing, Gary. I wish there were more stories here like your,
and that everyone would understand that CB and ham radio are both radio
hobbies, just different. What you said abot four watts is completely true:
if you want more than that, why not study for a ticket.

73, Kari, Finland
(also got the nick "Gary", hi)

I am seriously considering buying the RCI-2990-dx (export version) and would appreciate any feedback on this or other RCI models such as performance,modulation,etc.. also any recommendations on a better radio with similar specs in this price range ($600-$1,000) would be much appreciated.

thanks,
Dan
Ps. the e-mail is not real due to all the a-holes out there who do not approve of the use of this radio.

Pretty good post. Most of the flamers are likely the same folks who want to cut you off in traffic anyways. Just put on your asbestos long johns and enjoy. BTW - what you mentioned about choosing your channels is one reason I usually use 444.850 MHz although my ticket allows a whole lot more. What you see here also goes on in the amateur newsgroups - and on the air both on CB and amateur radio.

ok here is my 2 cents worth

1. freebanding, those bands are allocated for a specific use while they
may not get used often they do have specific uses, like some of the
freq's below the 40 cb channels are for oil spill emergencies, like that
is going to effect me in ohio. but regardless it is there for that
reason. so lets out it this way, say you have several phone lines to
your house (I do), one for regular phone use and one for internet
access. and someone comes along and pirates your internet line for their
pesonal use, you may only go online long enough to check email or do a
quick web search, so it isn't in much use, but when you do need to use
it, you find someone else has pirated it and is using it, wouldn;t you
be upset, after all that line belongs to you not them.

2. the power situation, Ok I am not a power user, I do have some power sitting here not hooked up and not in use, why? I collect radio equiptment, both old cb and old ham radios, I am not a ham YET, I am planning on aking the test this month. those ham radios and the amps are sitting in a closet on shelves. I do not need power to talk to my friends, and for dx,,, it isn't a challenge to talk around the world with 1kw power, want a challenge? talk dx on a plain barefoot radio. I have done it it is alot more exciting. I am looking forward to getting my ticket and trying to make contact with low power. I would not be opposed however to an increase in the limit on 11m to say 50 watts mobile and 25 base.

In the price range that you quoted, a nice ham rig would be your best option. Furthermore, if..(sorry, but it will happen)......not if, but when you decide that chickenbanding gets old, you have the radio you need to work the ham bands.

757 GX has a very good AM audio circuit when tuned right. For the price
range you are looking at you would be able to fill it with all the goodies
that where available for that rig and still have change left.

get yourself a good kenwood like a 450 or a 570.why waste your money get a rig that has all the bands one day you might decide to take your test and then you'd already have the radio. all ham rigs will do over 100 watts out.and the two i mentioned above have auto tuner in them. and they sure sound good on all bands. chris

Source record: 77774

I have a Comanche Warrior for sale....8 weeks old. Factory fresh mint condition. This is the same radio as the Prostar 497, Titan, Albrect or the Eagle Tomahawk etc. The unit is completely stock, except for the export channel modification which entailed nothing more than clipping a resistor. 450 channels covering 25.165mhz thru 29.655mhz in all modes including FM. Channel change from the microphone. Radio does not have over an hour on it, if that. Absolute perfect as-new condition...no scratches, marks, dents or damage of any kind. Price is $115 shipped to your door. I have the best buy on a radio like this on the net...period. Comes with original box, manual, hardware etc. Allot of radio for the money. Selling to buy mobile radio.

I would like to invite you to come and visit
"The Radio Classifieds".

I do not represent any business on my website nor do I sell any products
on my website. I am not doing this for personal gain. This is open for
all to post ad's about anything radio related.

There are many areas set up for Buying, Selling, Information &
Discussions
like:

FREE Auction with NO Listing Or Commission Fee's & NO Deletions
CB Radio
Ham Radio
Police Scanners
Short-Wave Radio
Antennas
Microphones
Test Equipment
Amplifers
Parts
Online Live Broadcasts Links
Political News
Crimes & Coverups
Joke Tellers Corner

Plus Much Much More! There are 25 Different Topics Of Interest!

It is not like a lot of the everyday forums out there that get totally
out of control. You can read messages, but you have to register to be
able to post messages to this forum. This way it keeps a lot of the
trouble makers out of the areas and makes it a much nicer place to
visit.

The address To The Radio Classifieds is as follows:

http://www.coolboard.com/myboards.cfm?d=40219711935539

Please come by and leave your link on my Free-Links pages as well.

I hope to see you there.

Thanks
"Charger"

This is exactly what is happening in broadcast radio. In 1996, our Congre$$ bent over for the high-dollar lobbyists and passed the Telecommunications Act. This threw out the previous ownership limits and allowed companies to own an unlimited number of radio stations. Result? A handful of large, greedy conglomerates now own virtually ALL the viable stations in American cities of any size. Programming is bland, unimaginative, and has become "nationalized."

Because of this, an unprecidented number of low-power, unlicensed FM stations are now in operation. These provide the local, community-oriented programming which the broadcasting megaopolies do not.

>
>Any reccommendations are appreciated

Look for an older model with a full-length telescoping antenna. The newer versions use "rubber duckies", which are completely inefficient on CB frequencies.

Also look for a model which allows you to use 10 "AA" cells, instead of the usual 8. This was done to accomodate the lower voltage of rechargeable batteries (1.2V X 10 = 12.5 volts.) Otherwise, when using rechargeables, you will only have 9.6 volts, which doesn't cut it.

A little help please.
Want to buy a hand held to keep in the boat while fishing, and in the car
just in case.
Saw a Cobra 46wx @ about $45.00 with incl. shipping.
Like it because it has weather bands,charger pack, and cigarette lighter
plug.
I'm really not looking for a serious radio, just something that will do the
job
for the least money.
Is this an okay choice or is there better in this price range ?
Thanks for your help, Old Lard Butt

Hello Sar727:

What type of station do you want to use, Mobile or Base Stations?

Some times 3 miles is no problem to reach, but during the day the CB signals from other stations many hundreds of miles away skip or are reflected off the atmosphere and return sounding like a bunch of buzzing Bee's. Making communication difficult at best at 3 miles, during the night no problem.

Can you give us more details?

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

Message-ID: <3AD05D50.C339CC4D@qnet.com>
Source record: 77849

Aw yes the Gonset G12 4 channel tube CB Radio.

I use to have one back in the mid 1960's. I would remove the 12 volt battery from my Dad's 1964 Ford Custom Cab (that had bright red bucket seats) and carry the battery up stairs to my room and turn the Gonset G12 on for a few hours before going dead. I had a 102 inch stainless steel whip antenna mounted on a 10 foot piece of pipe up on the roof. With the worlds oldest and worst RG-58 coax in the world. I would think the coax is in some Museum somewhere, ah?

The Gonset G12 had 4 channels, in my radio there where channels 5, 9, 11 and channel 15. During the weekends I could hear all kinds of skip stations talking to each other. I remember the Rebel on channel 5 in the San Fernando Valley (in California) talking to stations all over the country, on a General Radiotelephone MC-4 and a Gizmotche 3 element beam antenna. Channel 5 was a local hangout.

Channel 9 was the React channel, and fun to listen to at times.

Channel 11 was another local chit chat channel, with PL, K9, and a ontrouge of other distinguished CB'ers talking all the time. Coathanger John was on channel 13 and we could hear him on channels 11 and 15, he had a Johnson Viking Ranger, and a beam antenna. He talked to a bunch in Northridge and Conga Park areas.

Channel 15 was the local Sunland and Tujunga area channel, with a bunch all to its own, Ralph, Carl, Jeep, and a bunch of others, held this channel down.

The Old Mans Battery had to be recharged before being putting it back into the truck. I would recharge the battery while I was sleeping, and would install it back into Dad's truck before he left for work. I remember one morning forgetting to charge the battery, hearing dear old Dad letting the truck roll down hill so that he could start the engine by letting the clutch out. I got chewed out for that one.

But he didn't say a hole lot when we moved out of the house and the carpet had to be replace due to all the battery acid eating thru the carpet and padding, from where the truck battery was placed.

Also the Gonset G11, G12, and G14 have light bulbs in the antenna circuit, that lit when you transmitted, and of course got brighter as you spoke into the mic. None of my fancy ham equipment has a light bulb in the antenna circuit!

Source record: 77851

What kind of station are you building,Mobile or Base??
For the car get a Cobra 29LTD or GTL but avoid the S/T. Take it to the local
CB shop for a T/U.
Obtain your coax from the same CB shop(RG8/X).The ultimate mobile antenna is
the102"1/4wave-
whip. Radio Shack sells them for $20.oo, mount the antenna as high as
possible. You will probably
have to add a spring to the base of the antenna to get a good SWR on
11meter. The SWR has to be below 1.5:1 if you expect to reach out and touch
people, a 1.1:1 SWR should be your goal.
You may have to enlist some help from a tech. when tuning the antenna,
because it is the heart
of any great system. You could use all this on a base station as well, just
add a 5amp power-supply.
P.S. You dont need or want an amplifier,amplifiers dont make you get out
farther. They only make the signal louder, The antenna determines how far
you talk,put your money where your mouth is.
Let me know if you wanna build a great sounding rig and i will help you out,
i have outlined the basics for you which are a good platform to build on.
Good Luck.....

A QUOTE:" am seriously considering buying the RCI-2990-dx (export version) and would appreciate any feedback on.......also any recommendations on a better radio with similar specs in this price range ($600-$1,000) would be much appreciated..."
First, in case you don't realize, there aren't actually any "versions" of the 2990DX, your just paying someone to plug in the jumper & "do the mod".
Second, You would be nuts to buy that radio , when for the same price range you could TAKE Your Pick of Brand New REAL HF 100w Amateur radios (Yaesu FT-600 & 840 & FT-100, Icom 718 & 706, Alinco DX-77 & 70, etc..) These radios have receivers that will blow away the 2990, & cover 1-30Mhz or more.
Sounds like you might be getting suckerd by ads on a shady Texas co's website, where every radio is a special "version", you can pay them extra for something like a "Super double spyplane super wacko tune up" etc....
